

Zynq UltraScale+ Device Packaging and Pinouts

Product Specification User Guide

UG1075 (v1.10) July 1, 2021

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
7/01/2021	1.10	<p>Added InFO package (UBVA530) throughout.</p> <p>Chapter 5, Mechanical Drawings: Added Figure 5-18 and Figure 5-20. Updated A_3 and A_4 dimensions in Figure 5-19, Figure 5-25, and Figure 5-30.</p> <p>Chapter 8, Soldering Guidelines: Updated Pb-Free Reflow Soldering to include Table 8-2, Figure 8-3, and Figure 8-4. Added the Strain Gauge Measurement, Solder Paste, and Component Placement sections.</p> <p>Chapter 9, Recommended PCB Design Rules for BGA Packages: Added Stencil section.</p> <p>Chapter 10, Edge Bonding Guidelines: Added chapter.</p>
6/24/2020	1.9	<p>Added the XCZU43DR, XCZU47DR, XCZU46DR, XCZU48DR, and XCZU49DR devices throughout document. Added the FFVH1760 and FSVH1760 packages throughout document.</p> <p>Chapter 2, PS Memory Interface Pin Guidelines: Updated the DDR3/3L Pinout Example for Supported Configurations, DDR4 Pin Rules, DDR4 Pinout Example for Supported Configurations, and LPDDR3 Pinout Example for Supported Configurations sections. Clarified the headings in Table 2-4 and updated the LPDDR3 64-bit column for PS_DDR_CKE0, PS_DDR_CKE1, PS_DDR_CS_N0, and PS_DDR_ODT0.</p> <p>Chapter 6, Package Marking: Added a new top-mark diagram (Figure 6-1).</p> <p>Chapter 8, Soldering Guidelines: Updated and removed notes linking to data sheets for reflow body temperatures.</p> <p>Chapter 11, Thermal Specifications: Added links to Package Thermal Data Query for thermal simulation data.</p>
7/12/2019	1.8	<p>Added the XAZU7EV, XAZU11EG, XCZU39DR, XQZU3EG, XQZU9EG, XQZU11EG, XQZU19EG, XQZU21DR, XQZU28DR, and XQZU29DR devices throughout. Added the SFRA484, FFRD1156, FFRE1156, FFRB1517, FFRG1517, FFRC1760, and FFRF1760 packages where applicable.</p> <p>Updated the recommended applied pressure range on page 269.</p>

Date	Version	Revision
1/31/2019	1.7	<p>Chapter 1: Added an Important Note about XQ devices with eutectic BGA balls on page 12. Added the XQZU5EV (SFRC784, FFRB900), XQZU7EV (FFRB900, FFRC1156), and XQZU15EG (FFRC900, FFRB1156) device/package combinations to Table 1-1, Table 1-2, Table 1-3, Table 1-6, Table 1-7, and the associated bank diagram figures in this section. In Table 1-4, added the type and direction data for VCCO_PSIO[0:3]_ [500:503] and VCCO_PSDDR. Added a note for XQ ruggedized packages to VCCAUX_IO. Revised the GTH Quad 229 coordinates in Figure 1-16. Fixed GTH Quad location errors in Figure 1-22 through Figure 1-24.</p> <p>Chapter 2: Updated the DDR3/3L Pinout Example for Supported Configurations description and added VCCO_PSDDR and Note 1 to Table 2-1. Updated the DDR4 Pinout Example for Supported Configurations description and added VCCO_PSDDR to Table 2-2 and Note 1. Also in Table 2-2, added to guidelines for PS_DDR_A17, and PS_DDR_DQ32 to PS_DDR_DQ63. Updated the LPDDR4 Pinout Example for Supported Configurations description and added VCCO_PSDDR to Table 2-3 and Note 1. Updated the LPDDR3 Pinout Example for Supported Configurations description and added VCCO_PSDDR to Table 2-4 and Note 1.</p> <p>Chapter 3: Added an Important Note about XQ devices with eutectic BGA balls on page 116. Added the XQZU5EV (SFRC784, FFRB900), XQZU7EV (FFRB900, FFRC1156), and XQZU15EG (FFRC900, FFRB1156) device/package combinations to Table 3-1 labeled as production.</p> <p>Chapter 4: Added an Important Note about XQ devices with eutectic BGA balls on page 119. In Table 4-1, added the XQZU5EV (SFRC784, FFRB900), XQZU7EV (FFRB900, FFRC1156), and XQZU15EG (FFRC900, FFRB1156) device/package combinations.</p> <p>Chapter 5: Added an Important Note about XQ devices with eutectic BGA balls on page 199. In Table 5-1, added the XQZU5EV (SFRC784, FFRB900), XQZU7EV (FFRB900, FFRC1156), and XQZU15EG (FFRC900, FFRB1156) device/package combinations. Added Figure 5-5, Figure 5-10, Figure 5-13, and Figure 5-14.</p> <p>Chapter 6: Updated Table 6-1 and added Figure 6-3.</p> <p>Chapter 7: Added an Important Note about XQ devices with eutectic BGA balls on page 239. In Table 7-1, added the ruggedized packages (SFRC784, FFRB900, FFRC900, FFRB1156, and FFRC1156).</p> <p>Chapter 8: Updated the chapter with more information on eutectic packages including adding the Sn/Pb Reflow Soldering section. In Table 8-3, added the ruggedized packages (SFRC784, FFRB900, FFRC900, FFRB1156, and FFRC1156).</p> <p>Chapter 11: Added an Important Note about XQ devices with eutectic BGA balls on page 260. In Table 11-1, added the XQZU5EV (SFRC784, FFRB900), XQZU7EV (FFRB900, FFRC1156), and XQZU15EG (FFRC900, FFRB1156) device/package combinations.</p>

Date	Version	Revision
8/20/2018	1.6	<p>Chapter 1: Added the XAZU4EV and XAZU5EV devices in the SFVC784 package. This includes updates to Table 1-2, Table 1-3, Table 1-5, Table 1-6, Table 1-7, Figure 1-7, and Figure 1-8. Corrected the VCCO_PSSDDR pin name (from VCCO_PSSDDR_504) in Table 1-4. Added a note to Figure 1-3 on page 47.</p> <p>Chapter 2: Clarified what a byte lane includes in the pin swapping restrictions discussions on page 93 and page 97.</p> <p>Chapter 3: Added the XAZU4EV and XAZU5EV devices to Table 3-1. Labeled all of the devices in Table 3-2 as production.</p> <p>Chapter 4: In Table 4-1, added the XAZU4EV and XAZU5EV devices and changed the XCZU21DR, XCZU25DR, XCZU27DR, XCZU28DR, and XCZU29DR device labels to production. Added a note above Figure 4-1 on page 123. Added the XAZU4EV and XAZU5EV devices in the SFVC784 package to Figure 4-11 and Figure 4-12.</p> <p>Chapter 5: Added the XAZU4EV and XAZU5EV devices to Table 5-1 and Figure 5-6. Labeled all of the devices in Table 5-2 as production.</p> <p>Chapter 11: Added the XAZU4EV and XAZU5EV devices to Table 11-1.</p>
4/10/2018	1.5	<p>Chapter 1: Added the XCZU21DR, XCZU25DR, XCZU27DR, XCZU28DR, and XCZU29DR devices. This includes updates to Table 1-1, Table 1-2, Table 1-3, Table 1-4, Table 1-5, Table 1-6, and Table 1-7. Added Figure 1-31 through Figure 1-42.</p> <p>Chapter 3: Added the XCZU21DR, XCZU25DR, XCZU27DR, XCZU28DR, and XCZU29DR ASCII file links, see Table 3-2.</p> <p>Chapter 4: Added the XCZU21DR, XCZU25DR, XCZU27DR, XCZU28DR, and XCZU29DR devices to Table 4-1.</p> <p>Chapter 5: Added the XCZU21DR, XCZU25DR, XCZU27DR, XCZU28DR, and XCZU29DR mechanical drawings, see Table 5-2.</p> <p>Chapter 7: Added the FFVD1156, FFVE1156, FSVE1156, FFVG1517, FSVG1517, FFVF1760, and FSVF1760 packages to Table 7-1.</p> <p>Chapter 8: Revised the guidelines in Table 8-1 for Ramp-up rate, Peak temperature (lead/ball), and Peak temperature (body). Revised the same information in Figure 8-2. Added the FFVD1156, FFVE1156, FSVE1156, FFVG1517, FSVG1517, FFVF1760, and FSVF1760 packages to Table 8-3.</p> <p>Chapter 11: Added the XCZU21DR, XCZU25DR, XCZU27DR, XCZU28DR, and XCZU29DR devices to Table 11-1 and added Note 1.</p> <p>Chapter 12: Updated the System Level Heat Sink Solutions section and added the Heat Sink Removal and Measurement Debug sections.</p>

Date	Version	Revision
12/21/2017	1.4	<p>Added the XAZU2EG and XAZU3EG devices throughout the document.</p> <p>Chapter 1: Revise the VCCINT_VCU description in Table 1-4. Updated the ZU11EG (Figure 1-17 through Figure 1-21) PCIe4 bank coordinates.</p> <p>Chapter 2: Updated LPDDR4 Pin Swapping Restrictions and DDR4 Pin Swapping Restrictions and removed Figure 2-1: DDR Controller Implementation of DQ Mapping. In Table 2-2, updated the PS_DDR_ZQ connections.</p> <p>Chapter 5: Revised Figure 5-7: Symbol A from (2.57/2.77/2.97) to (2.48/2.68/2.88) and Symbol A2 from (1.27/1.42/1.62) to (1.18/1.33/1.48).</p> <p>Chapter 6: Revised the top mark diagram to show both older device versions and newer ones with a 2D bar code.</p> <p>Chapter 8: Added an Important note on page 240 about reflow rework.</p> <p>Chapter 11: Updated the SFVC784, FFVC900, FFVB1156, FFVC1156, FFVB1517, FFVF1517 data to account for the stamped lid in Table 11-1.</p>
8/29/2017	1.3	<p>In Chapter 1, updated Figure 1-3, Figure 1-14, Figure 1-15, Figure 1-16, Figure 1-22, Figure 1-23, Figure 1-24, Figure 1-25, Figure 1-26, Figure 1-27, Figure 1-28, and Figure 1-29. Revise the VCCINT_VCU description in Table 1-4.</p> <p>In Chapter 2, updated the DDR4 Pin Rules and the DDR4 Pin Swapping Restrictions. In Table 2-2, updated the configurations for PS_DDR_CK_N1 (DDR4 1Rank).</p> <p>In Chapter 3, updated the package specification designation of many of the packages listed in Table 3-1.</p> <p>In Chapter 4, updated Table 4-1 and added the following device diagrams: SFVC784 Package–XCZU4CG, XCZU4EG, XCZU5CG, and XCZU5EG, SFVC784 Package–XCZU4EV, XCZU5EV, XAZU4EV, and XAZU5EV, FBVB900 Package–XCZU4CG, XCZU4EG, XCZU5CG, and XCZU5EG, FBVB900 Package–XCZU4EV and XCZU5EV, FFVF1517 Package–XCZU7CG and XCZU7EG, FFVC1156 Package–XCZU7EV, FFVC1156 Package–XCZU11EG, FFVB1517 Package–XCZU11EG, FFVF1517 Package–XCZU11EG, and FFVC1760 Package–XCZU11EG.</p> <p>In Chapter 5, replace Figure 5-6, added Figure 5-7, Figure 5-8, Figure 5-22, and Figure 5-31.</p> <p>In Table 8-3, update the FFV packages to a mass reflow of 245°C.</p>
1/13/2017	1.2	<p>Added the following devices throughout: XCZU2CG, XCZU3CG, XCZU4CG, XCZU4EG, XCZU5CG, XCZU5EG, XCZU6CG, XCZU7CG, XCZU7EG, and XCZU9CG. In Table 1-3, revised the available PS I/O pin values for the SBVA484 and SFVA625 packages. In Table 1-4, updated the PS_MODE directions and the pin descriptions in the Power/Ground Pins section. In Table 1-6, revised the XCZU4 bank numbers and updated the FBVB900 mapping. Revised the mapping for the FBVB900 package in Table 1-7. Revised the Bank Locations of Dedicated and Multi-Function Pins section. Updated the HD I/O bank numbers in Figure 1-21.</p> <p>Added Chapter 2, PS Memory Interface Pin Guidelines. Added the Chapter 3, Package Specifications Designations section. In Table 3-1, updated links. Chapter 4, Device Diagrams and Chapter 5, Mechanical Drawings have updated tables and new diagrams. Revised the Bar Code section of Table 6-1 to include changes outlined in XCN16014: Top Marking change for 7 Series, UltraScale, and UltraScale+ Products. Updated the AUTOMOTIVE APPLICATIONS DISCLAIMER.</p>

Date	Version	Revision
6/14/2016	1.1	In Table 1-3 , updated Note 1 and the SBVA484 package total user HP I/Os. Clarified the I2C_SCLK and I2C_SDA descriptions and added SMBALERT and VCCINT_VCU to Table 1-4 . Also updated the Multi-gigabit Serial Transceiver Pins (GTHE4, GTYE4, and PS-GTR) descriptions, Added further descriptions in the Die Level Bank Numbering Overview including adding an example device diagram (Figure 1-1). In Chapter 4 , added new figures and updated all of the graphics because the PERSTN pins and SMBALERT pins have moved. Updated Figure 5-13 and added Figure 5-15 . Added the bar code description in Chapter 6 .
1/20/2016	1.0.2	Replaced the missing graphics in Chapter 1 .
12/18/2015	1.0.1	Updated the package file links in Chapter 3 .
11/24/2015	1.0	Initial Xilinx release.

Summary	119
SBVA484 Package—XCZU2CG, XCZU2EG, XCZU3CG, XCZU3EG, XAZU2EG, and XAZU3EG	123
UBVA530 Package—XCZU2CG, XCZU2EG, XCZU3CG, and XCZU3EG	125
SFVA625 Package—XCZU2CG, XCZU2EG, XCZU3CG, XCZU3EG, XAZU2EG, and XAZU3EG	127
SFVC784 Package—XCZU2CG, XCZU2EG, XCZU3CG, XCZU3EG, XAZU2EG, and XAZU3EG	129
SFVC784 Package—XCZU4CG, XCZU4EG, XCZU5CG, and XCZU5EG	131
SFVC784 Package—XCZU4EV, XCZU5EV, XAZU4EV, and XAZU5EV	133

FBVB900 Package—XCZU4CG, XCZU4EG, XCZU5CG, and XCZU5EG	135
FBVB900 Package—XCZU4EV and XCZU5EV	137
FBVB900 Package—XCZU7CG and XCZU7EG	139
FBVB900 Package—XCZU7EV	141
FFVC900 Package—XCZU6EG, XCZU9EG, and XCZU15EG	143
FFVB1156 Package—XCZU6EG, XCZU9EG, and XCZU15EG	145
FFVC1156 Package—XCZU7CG and XCZU7EG	147
FFVC1156 Package—XCZU7EV	149
FFVC1156 Package—XCZU11EG	151
FFVD1156 Package—XCZU21DR	153
FFVE1156 and FSVE1156 Packages—XCZU25DR	155
FFVE1156 and FSVE1156 Packages—XCZU27DR and XCZU28DR	157
FFVE1156 and FSVE1156 Packages—XCZU43DR	159
FFVE1156 and FSVE1156 Packages—XCZU47DR	161
FFVE1156 and FSVE1156 Packages—XCZU48DR	163
FFVB1517 Package—XCZU11EG	165
FFVB1517 Package—XCZU17EG and XCZU19EG	167
FFVF1517 Package—XCZU7CG and XCZU7EG	169
FFVF1517 Package—XCZU7EV	171
FFVF1517 Package—XCZU11EG	173
FFVG1517 and FSVG1517 Packages—XCZU25DR	175
FFVG1517 and FSVG1517 Packages—XCZU27DR and XCZU28DR	177
FFVG1517 and FSVG1517 Packages—XCZU43DR	179
FFVG1517 and FSVG1517 Packages—XCZU47DR	181
FFVG1517 and FSVG1517 Packages—XCZU48DR	183
FFVC1760 Package—XCZU11EG	185
FFVC1760 Package—XCZU17EG and XCZU19EG	187
FFVD1760 Package—XCZU17EG and XCZU19EG	189
FFVF1760 and FSVF1760 Packages—XCZU29DR and XCZU39DR	191
FFVF1760 and FSVF1760 Packages—XCZU49DR	193
FFVH1760 and FSVH1760 Packages—XCZU46DR	195
FFVE1924 Package—XCZU17EG and XCZU19EG	197

Chapter 5: Mechanical Drawings

Summary	199
SBVA484 Flip-Chip, Fine-Pitch BGA (XCZU2, XCZU3, XAZU2EG, and XAZU3EG)	204
SFRA484 Flip-Chip, Fine-Pitch BGA (XQZU3EG)	205
UBVA530 Flip-Chip, Fine-Pitch BGA (XCZU2, XCZU3)	206
SFVA625 Flip-Chip, Fine-Pitch BGA (XCZU2, XCZU3, XAZU2EG, and XAZU3EG)	207
SFRC784 Ruggedized Flip-Chip BGA (XQZU3EG and XQZU5EV)	208

SFVC784 Flip-Chip, Fine-Pitch BGA (XCZU2, XAZU2EG, XCZU3, XAZU3EG, XCZU4, XAZU4EV, XCZU5, and XAZU5EV)	209
FBVB900 Flip-Chip, Fine-Pitch BGA (XCZU4CG, XCZU4EG, XCZU4EV, XCZU5CG, XCZU5EG, and XCZU5EV)	210
FBVB900 Flip-Chip, Fine-Pitch BGA (XCZU7CG, XCZU7EG, XCZU7EV, and XAZU7EV)	211
FFRB900 (XQZU7EV) Ruggedized Flip-Chip BGA	212
FFRB900 (XQZU5EV) and FFRC900 (XQZU9EG and XQZU15EG) Ruggedized Flip-Chip BGA	213
FFVC900 Flip-Chip, Fine-Pitch BGA (XCZU6CG, XCZU6EG, XCZU9CG, XCZU9EG, and XCZU15EG).	214
FFRB1156 Ruggedized Flip-Chip BGA (XQZU9EG and XQZU15EG)	215
FFVB1156 Flip-Chip, Fine-Pitch BGA (XCZU6CG, XCZU6EG, XCZU9CG, XCZU9EG, and XCZU15EG)	216
FFRC1156 Ruggedized Flip-Chip BGA (XQZU7EV and XQZU11EG)	217
FFVC1156 Flip-Chip, Fine-Pitch BGA (XCZU7CG, XCZU7EG, XCZU7EV, and XCZU11EG).....	218
FFRD1156 (XQZU21DR) Ruggedized Flip-Chip BGA	219
FFRE1156 (XQZU28DR) Ruggedized Flip-Chip BGA	220
FFVD1156 (XCZU21DR) Flip-Chip, Fine-Pitch BGA	221
FFVE1156 (XCZU25DR, XCZU27DR, XCZU28DR, XCZU43DR, XCZU47DR, XCZU48DR) Flip-Chip, Fine-Pitch BGA	222
FSVE1156 (XCZU25DR, XCZU27DR, XCZU28DR, XCZU43DR, XCZU47DR, XCZU48DR) Flip-Chip, Fine-Pitch, Lidless w/Stiffener Ring BGA	223
FFRB1517 (XQZU19EG) Ruggedized Flip-Chip BGA	224
FFVB1517 (XCZU11EG, XCZU17EG, and XCZU19EG) and FFVF1517 (XCZU7CG, XCZU7EG, XCZU7EV, XCZU11EG, and XAZU11EG) Flip-Chip, Fine-Pitch BGA	225
FFRG1517 (XQZU28DR) Ruggedized Flip-Chip BGA	226
FFVG1517 (XCZU25DR, XCZU27DR, XCZU28DR, XCZU43DR, XCZU47DR, XCZU48DR) Flip-Chip, Fine-Pitch BGA	227
FSVG1517 (XCZU25DR, XCZU27DR, XCZU28DR, XCZU43DR, XCZU47DR, XCZU48DR) Flip-Chip, Fine-Pitch, Lidless with Stiffener Ring BGA	228
FFVC1760 and FFVD1760 Flip-Chip, Fine-Pitch BGA (XCZU11EG, XCZU17EG, and XCZU19EG)	229
FFRC1760 Ruggedized Flip-Chip BGA (XQZU11EG and XQZU19EG)	230
FFVF1760 (XCZU29DR, XCZU39DR, XCZU49DR) and FFVH1760 (XCZU46DR) Flip-Chip, Fine-Pitch BGA	231
FFRF1760 (XQZU29DR) Ruggedized Flip-Chip BGA	232
FSVF1760 (XCZU29DR, XCZU39DR, XCZU49DR) and FSVH1760 (XCZU46DR) Flip-Chip, Fine-Pitch, Lidless with Stiffener Ring BGA	233
FFVE1924 Flip-Chip, Fine-Pitch BGA (XCZU17EG, and XCZU19EG)	234

Packaging Overview

Introduction to the UltraScale Architecture

The Xilinx® UltraScale™ architecture is the first ASIC-class architecture to enable multi-hundred gigabit-per-second levels of system performance with smart processing, while efficiently routing and processing data on-chip. UltraScale architecture-based devices address a vast spectrum of high-bandwidth, high-utilization system requirements by using industry-leading technical innovations, including next-generation routing, ASIC-like clocking, 3D-on-3D ICs, multiprocessor SoC (MPSoC) technologies, and new power reduction features. The devices share many building blocks, providing scalability across process nodes and product families to leverage system-level investment across platforms.

Virtex® UltraScale+™ devices provide the highest performance and integration capabilities in a FinFET node, including both the highest serial I/O and signal processing bandwidth, as well as the highest on-chip memory density. As the industry's most capable FPGA family, the Virtex UltraScale+ devices are ideal for applications including 1+Tb/s networking and data center and fully integrated radar/early-warning systems.

Kintex® UltraScale+ devices provide the best price/performance/watt balance in a FinFET node, delivering the most cost-effective solution for high-end capabilities, including transceiver and memory interface line rates as well as 100G connectivity cores. Our newest mid-range family is ideal for both packet processing and DSP-intensive functions and is well suited for applications including wireless MIMO technology, Nx100G networking, and data center.

Zynq® UltraScale+ MPSoC devices provide 64-bit processor scalability while combining real-time control with soft and hard engines for graphics, video, waveform, and packet processing. Integrating an Arm®-based system for advanced analytics and on-chip programmable logic for task acceleration creates unlimited possibilities for applications including 5G Wireless, next generation ADAS, and Industrial Internet-of-Things.

Zynq UltraScale+ RFSoc integrate the key subsystems required to implement a complete software-defined radio including direct RF sampling data converters, enabling CPRI and gigabit Ethernet-to-RF on a single, highly programmable SoC. Each device offers multiple RF-sampling analog-to-digital (RF-ADC) and RF-sampling digital-to-analog (RF-DAC) data converters. The data converters are high-precision, high-speed and power efficient.

For the latest Zynq UltraScale+ device descriptions, specifications, data sheets, and user guides are available at www.xilinx.com/documentation.

Zynq UltraScale+ Device Packaging and Pinouts

This section describes the packages and pinouts for the in various organic flip-chip 0.5 mm, 0.8 mm, and 1.0 mm pitch BGA packages.

IMPORTANT: All standard packages are lead-free (signified by an additional V in the package name). All devices supported in a particular package are footprint compatible. Each device is split into I/O banks to allow for flexibility in the choice of I/O standards. See the *UltraScale Architecture SelectIO Resources User Guide (UG571)* [Ref 6].

The flip-chip assembly materials for the Zynq UltraScale+ devices are manufactured using ultra-low alpha (ULA) materials defined as <0.002 cph/cm² or materials that emit less than 0.002 alpha-particles per square centimeter per hour.

IMPORTANT: All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC or XA, and the Pb-free signifier in the package name is Q.

Differences from Previous Generations

The packaging and pinout specifications for Zynq UltraScale+ devices differ from past generations, including the Zynq-7000 SoCs. These details are outlined in this section.

- All package and die components, including flip-chip solder bumps, are lead-free.
- Package names contain a single-character alphabetic designator followed by the exact number of pins found on the package.
- VCCAUX_IO pins are not divided into bank groups. VCCAUX_IO must be connected to VCCAUX at the board level.
- Internal logic is separated from I/O logic by the addition of the VCCINT_IO power pins. VCCINT_IO must be connected to VCCBRAM (depending on the device speed grade and voltage settings) at the board level.
- Groups of gigabit serial transceiver (GT) power pins are separated by column for each column of GT Quads.
- Standard HP I/O banks each have a total of 52 SelectIO™ pins, optionally configurable as (up to) 24 differential pairs.
- Standard HD I/O banks each have a total of 24 SelectIO pins, optionally configurable as (up to) 12 differential pairs.
- Each bank has one dedicated VREF pin. These pins cannot be used as user I/Os.

- Four differential clock pin pairs per bank consist of a single type of global clock (GC or HDGC) input.
- Four memory byte groups per HP I/O bank are each separated into an upper and a lower memory byte group.
- Multiple PL configuration pins are removed.
- A POR_OVERRIDE pin is used to override the default power-on-reset delay. See [Table 1-4](#).

Device/Package Combinations

[Table 1-1](#) shows the size and BGA pitch of the Zynq UltraScale+ device packages. All packages are available with eutectic BGA balls. For these packages, the Pb-free signifier in the package name is a Q.

Table 1-1: Package Specifications

Packages	Description	Package Specifications		
		Package Type	Pitch (mm)	Size (mm)
UBVA530	Flip-chip, integrated fan out (InFO), bare-die	BGA	0.5	16 x 9.5
SBVA484	Flip-chip, bare-die		0.8	19 x 19
SFRA484	Ruggedized flip-chip, bare-die			19 x 19
SFVA625	Flip-chip			21 x 21
SFVC784	Flip-chip			23 x 23
SFRC784	Ruggedized flip-chip		1.0	31 x 31
FBVB900	Flip-chip, bare-die			
FFRB900	Ruggedized flip-chip			
FFVC900	Flip-chip			
FFRC900	Ruggedized flip-chip

Gigabit Transceiver Channels by Device/Package

Table 1-2 lists the quantity of gigabit transceiver channels for the Zynq UltraScale+ devices. In all devices, a PS-GTR, GTH, or GTY channel is one set of MGTRXP, MGTRXN, MGTTXP, and MGTTXN pins. All packages are available with eutectic BGA balls. For these packages, the device type is XQ and the Pb-free signifier in the package name is a Q.

User I/O Pins by Device/Package

Table 1-3 lists the number of available PS I/Os, 3.3V-capable high-density (HD), and 1.8V-capable high-performance (HP) I/Os and the number of HD or HP differential I/O for each device/package combination. All packages are available with eutectic BGA balls. For these packages, the device type is XQ and the Pb-free signifier in the package name is a Q.

Notes:

1. The maximum user I/O numbers do not include the GT serial transceiver pins or the PUDC_B and POR_OVERRIDE pins used for configuration.

Pin Definitions

Table 1-4 lists the pin definitions.

Table 1-4: Pin Definitions

Pin Name	Type	Direction	Description
User I/O Pins			
IO_L[1 to 24][P or N]_T[0 to 3] [U or L]_N[0 to 12]_ [multi-function]_[bank number] or IO_T[0 to 3][U or L]_N[0 to 12]_[multi-function]_[bank number]			
	Dedicated	Input/Output	<p>Most user I/O pins are capable of differential signaling and can be implemented as pairs. Each user I/O pin name consists of several indicator labels, where:</p> <ul style="list-style-type: none"> IO indicates a user I/O pin. L[1 to 24] indicates a unique differential pair with P (positive) and N (negative) sides. User I/O pins without the L indicator are single-ended. T[0 to 3][U or L] indicates the assigned byte group and nibble location (upper or lower portion) within that group for the pin. N[0 to 12] the number of the I/O within its byte group. [multi-function] indicates any other functions that the pin can provide. If not used for this function, the pin can be a user I/O. [bank number] indicates the assigned bank for the user I/O pin.
User I/O Multi-Function Pins			
GC or HDGC	Multi-function	Input	<p>Four global clock (GC or HDGC) pin pairs are in each bank. HDGC pins have direct access to the global clock buffers. GC pins have direct access to the global clock buffers and the MMCMs and PLLs that are in the clock management tile (CMT) adjacent to the same I/O bank. GC and HDGC inputs provide dedicated, high-speed access to the internal global and regional clock resources. GC and HDGC inputs use dedicated routing and must be used for clock inputs where the timing of various clocking features is imperative.</p> <p>Up-to-date information about designing with the GC (or HDGC) pin is available in the <i>UltraScale Architecture Clocking Resources User Guide</i> (UG572) [Ref 7]</p>
VRP ⁽¹⁾	Multi-function	N/A	<p>This pin is for the DCI voltage reference resistor of P transistor (per bank, to be pulled Low with a reference resistor).</p>

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
DBC QBC	Multi-function	Input	Byte lane clock (DBC and QBC) input pin pairs are clock inputs directly driving source synchronous clocks to the bit slices in the I/O banks. In memory applications, these are also known as DQS. For more information, consult the <i>UltraScale Architecture SelectIO Resources User Guide</i> (UG571) [Ref 6].
PERSTN[0 to 1]	Multi-function	Input	Default reset pin locations for the integrated block for PCI Express.
Configuration Pins			
For more information on configuration and recommended external pull-up/pull-down resistors, see the <i>Zynq UltraScale+ Device Technical Reference Manual</i> (UG1085) [Ref 10] and the <i>UltraScale Architecture PCB and Pin Planning User Guide</i> (UG583) [Ref 14].			
PUDC_B	Dedicated	Input	Active-Low input enables internal pull-ups during configuration on all SelectIO pins: 0 = Weak preconfiguration I/O pull-up resistors enabled. 1 = Weak preconfiguration I/O pull-up resistors disabled. PUDC_B is powered by V_{CCAUX} .
POR_OVERRIDE	Dedicated	Input	Power-on reset delay override. 0 = Standard PL power-on delay time (recommended default). 1 = Faster PL power-on delay time. CAUTION! Do not allow this pin to float before and during configuration. This pin must be tied to V_{CCINT} or GND.
PS_DONE	Dedicated	Output	PS DONE signal. Requires an external pull-up resistor.
PS_ERROR_OUT	Dedicated	Output	PS error indication.
PS_ERROR_STATUS	Dedicated	Output	PS error status.
PS_INIT_B	Dedicated	Input/Output	Initialization completion indicator after POR. High voltage indicates completion of initialization (PL). Requires an external pull-up resistor.
PS_JTAG_TCK	Dedicated	Input	JTAG data clock.
PS_JTAG_TDI	Dedicated	Input	JTAG data input.
PS_JTAG_TDO	Dedicated	Output	JTAG data output.
PS_JTAG_TMS	Dedicated	Input	JTAG mode select.
PS_MODE	Dedicated	Input/Output	PS MIO mode selection pins.
PS_PADI	Dedicated	Input	Crystal pad input. Real-time clock (RTC).
PS_PADO	Dedicated	Output	Crystal pad output. Real-time clock (RTC).

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
PS_POR_B	Dedicated	Input	Power on reset. PS_POR_B must be held at 0 until all PS power supplies meet voltage requirements and the PS_CLK reference is within specification. When deasserted the PS begins the boot process.
PS_PROG_B	Dedicated	Input	PROG_B signal to reset configuration block. Requires an external pull-up resistor.
PS_REF_CLK	Dedicated	Input	System reference clock. PS_CLK must be between 27 MHz and 60 MHz.
PS_SRST_B	Dedicated	Input	System reset. For use when debugging. When 0, forces the PS to enter the system reset sequence.
Power/Ground Pins			
For more information on voltage specifications see the <i>Zynq UltraScale+ MPSoC Data Sheet: DC and AC Switching Characteristics</i> [Ref 8] or the <i>Zynq UltraScale+ RFSoc Data Sheet: DC and AC Switching Characteristics</i> [Ref 9].			
GND	Dedicated	N/A	Ground.
RSVDGND	Dedicated	N/A	Reserved pins that must be tied to GND. Note: These pins are labeled differently depending upon the device. They can serve a different purpose between footprint compatible devices. To migrate to a footprint compatible device, account for any variation in pin functionality.
RSVD	Dedicated	N/A	Reserved pin. Leave floating.
VCCINT	Dedicated	N/A	Power-supply pins for the PL internal logic.
VCCINT_IO	Dedicated	N/A	Power-supply pins for the I/O banks. VCCINT_IO must be connected to VCCBRAM on the board.
VCCINT_VCU	Dedicated	N/A	Power-supply pins for the video codec unit (EV devices only). Note: If the video codec unit is not used, then connect the VCCINT_VCU pins to GND to reduce power. In the CG and EG devices, the EV device VCCINT_VCU pins appear as RSVDGND pins. Note: When migrating from an EV device to a CG or EG device in the same package, Xilinx recommends connecting the VCCINT_VCU pins to GND to reduce power. Further VCCINT_VCU migration guidelines are available in <i>UltraScale Architecture PCB and Pin Planning User Guide</i> (UG583) [Ref 14].  IMPORTANT: <i>VCCINT_VCU</i> requires its own dedicated power supply. Do not combine with other power rails on the PCB.
VCCAUX	Dedicated	N/A	Power-supply pins for auxiliary circuits.

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
VCCAUX_IO	Dedicated	N/A	Auxiliary power-supply pins for the I/O banks. VCCAUX_IO must be connected to VCCAUX on the board. Note: Package files for XQ ruggedized devices (for example: FFRC784) have unique pin names for VCCAUX_HPIO and VCCAUX_HDIO. These pins can be connected to a common VCCAUX_IO supply.
VCCBRAM	Dedicated	N/A	Power-supply pins for PL block RAM logic.
VCCO_[bank number] ⁽²⁾	Dedicated	N/A	Power-supply pins for the output drivers (per bank).
VREF_[bank number]	Dedicated	N/A	Voltage reference for input pins (per bank).
VCCADC	Dedicated	N/A	System Monitor analog supply voltage.
GNDADC	Dedicated	N/A	System Monitor analog ground.
VCC_PSADC	Dedicated	N/A	PS ADC supply voltage.
GND_PSADC	Dedicated	N/A	PS ADC analog ground.
VCC_PSAUX	Dedicated	N/A	PS auxiliary circuits supply voltage.
VCC_PSBATT	Dedicated	N/A	PS RTC battery supply voltage. When not used, tie to GND.
VCC_PSDDR_PLL	Dedicated	N/A	PS DDR PLL supply voltage.
VCC_PSPLL	Dedicated	N/A	PS PLL (DPLL, RPLL, APLL, VPLL, IOPLL) supply voltage.
VCC_PSINTFP	Dedicated	N/A	PS full-power domain supply voltage.
VCC_PSINTFP_DDR	Dedicated	N/A	PS DDR full-power domain supply voltage.
VCC_PSINTLP	Dedicated	N/A	PS low-power domain supply voltage.
VCCO_PSI0[0:3]_[500:503]	Dedicated	N/A	PS I/O supply voltage.
VCCO_PSDDR	Dedicated	N/A	PS DDR controller I/O supply voltage.
PS MIO Pins			
PS_MIO	Multi-function	Input/Output	Multiplexed I/O can be configured to support multiple I/O interfaces. These interfaces include SPI and Quad-SPI flash, NAND, USB, Ethernet, SDIO, UART, SPI, and GPIO interfaces.
PS DDR Pins			
PS_DDR_DQ	Dedicated	Input/Output	DRAM data.
PS_DDR_DQS_P	Dedicated	Input/Output	DRAM differential data strobe positive.
PS_DDR_DQS_N	Dedicated	Input/Output	DRAM differential data strobe negative.
PS_DDR_ALERT_N	Dedicated	Input	DRAM alert signal.
PS_DDR_ACT_N	Dedicated	Output	DRAM activation command.

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
PS_DDR_A	Dedicated	Output	DRAM row and column address.
PS_DDR_BA	Dedicated	Output	DRAM bank address.
PS_DDR_BG	Dedicated	Output	DRAM bank group.
PS_DDR_CK_N	Dedicated	Output	DRAM differential clock negative.
PS_DDR_CK	Dedicated	Output	DRAM differential clock positive.
PS_DDR_CKE	Dedicated	Output	DRAM clock enable.
PS_DDR_CS	Dedicated	Output	DRAM chip select.
PS_DDR_DM	Dedicated	Output	DRAM data mask.
PS_DDR_ODT	Dedicated	Output	DRAM termination control.
PS_DDR_PARITY	Dedicated	Output	DRAM parity signal
PS_DDR_RAM_RST_N	Dedicated	Output	DRAM reset signal, active low.
PS_DDR_ZQ	Dedicated	Input/Output	ZQ calibration signal.
System Monitor Pins⁽³⁾			
AD[0 to 15][P or N]	Multi-function	Input	System Monitor differential auxiliary analog inputs 0–15.
VREFP	Dedicated	N/A	Voltage reference input.
VREFN	Dedicated	N/A	Voltage reference GND.
VP	Dedicated	Input	System Monitor dedicated differential analog input (positive side).
VN	Dedicated	Input	System Monitor dedicated differential analog input (negative side).
I2C_SCLK	Multi-function	Bidirectional	I2C serial clock. Directly connected to the System Monitor DRP interface for I2C operation configuration.  <hr/> IMPORTANT: Because the SYSMON I2C interface is active after power-on, this pin should only be used for I2C access until after configuration.
I2C_SDA	Multi-function	Bidirectional	I2C serial data line. Directly connected to the System Monitor DRP interface for I2C operation configuration.  <hr/> IMPORTANT: Because the SYSMON I2C interface is active after power-on, this pin should only be used for I2C access until after configuration.

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
SMBALERT	Multi-function	Bidirectional	<p>Optional PMBus alert, interrupt signal. When Low, indicates a system fault that must be cleared using PMBus commands. Connect to SMBALERT_TS.</p> <p>For more information, see the <i>UltraScale Architecture System Monitor User Guide</i> [Ref 13].</p> <p></p> <p>IMPORTANT: By default, the PMBus is active prior to configuration. Only use as a multi-functional I/O pin in designs that can tolerate this pin being driven prior to configuration.</p> <hr/> <p>This pin is present on Kintex UltraScale+ and Virtex UltraScale+ devices.</p>
Multi-gigabit Serial Transceiver Pins (GTHE4, GTYE4, and PS-GTR)			
For more information on the GTH and GTY transceivers, see the <i>UltraScale Architecture GTH Transceivers User Guide</i> (UG576) [Ref 11] or <i>UltraScale Architecture GTY Transceivers User Guide</i> [Ref 12]. For more information on the PS-GTR transceivers, see the <i>Zynq UltraScale+ Device Technical Reference Manual</i> [Ref 10].			
MGTHRXP[P or N][0 to 3]_ _[GT quad number]	Dedicated	Input	RXP and RXN are the differential input pairs for each of the receivers in the GTH Quad.
MGTHTXP[P or N][0 to 3]_ _[GT quad number]	Dedicated	Output	TXP and TXN are the differential output pairs for each of the transmitters in the GTH Quad.
MGTYRXP[P or N][0 to 3]_ _[GT quad number]	Dedicated	Input	RXP and RXN are the differential input pairs for each of the receivers in the GTY Quad.
MGTYTXP[P or N][0 to 3]_ _[GT quad number]	Dedicated	Output	TXP and TXN are the differential output pairs for each of the transmitters in the GTY Quad.
PS_MGTRRX[P or N][0 to 3]_ _[GT quad number]	Dedicated	Input	RXP and RXN are the differential input pairs for each of the receivers in the PS-GTR Quad.
PS_MGTRTX[P or N][0 to 3]_ _[GT quad number]	Dedicated	Output	TXP and TXN are the differential output pairs for each of the transmitters in the PS-GTR Quad.
MGTAVCC_[L or R] [N or S] ⁽⁴⁾	Dedicated	Input	Analog power-supply pin for the receiver and transmitter internal circuits for the GTH or GTY transceivers.
PS_MGTRAVCC	Dedicated	N/A	Analog power-supply pin for the receiver and transmitter internal circuits for the PS-GTR transceivers.
MGTAVTT_[L or R] [N or S] ⁽⁴⁾	Dedicated	Input	Analog power-supply pin for the transmitter and receiver termination circuits for the GTH or GTY transceivers.
MGTVCCAUX_[L or R] [N or S] ⁽⁴⁾	Dedicated	Input	Auxiliary analog Quad PLL (QPLL) voltage supply for the transceivers.

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
PS_MGTRAVTT	Dedicated	N/A	Analog power-supply pin for the transmitter and receiver termination circuits for the PS-GTR transceivers.
MGTREFCLK[0 or 1] [P or N]	Dedicated	Input/Output	Configured as either reference clock input pins or as RX recovered clock output pins for the GTH or GTY transceivers.
PS_MGTREFCLK[0 to 3] [P or N]	Dedicated	Input	Differential reference clock for the PS-GTR transceivers.
MGTAVTTRCAL_[L or R] [N or S] ⁽⁴⁾	Dedicated	N/A	Bias current supply for the termination resistor calibration circuit.
MGTRREF_[L or R] [N or S] ⁽⁴⁾	Dedicated	Input	Calibration resistor pin for the termination resistor calibration circuit for the GTH or GTY transceivers.
PS_MGTRREF	Dedicated	Input	Calibration resistor pin for the termination resistor calibration circuit for the PS-GTR transceivers.
Zynq UltraScale+ RFSoc Dedicated Pins			
VCCSDFEC	Dedicated	N/A	Power supply for the FEC blocks.
VCCINT_AMS	Dedicated	N/A	Digital power supply for the DDC.
ADC_AVCC	Dedicated	N/A	Core ADC and PLL power supply.
ADC_AVCCAUX	Dedicated	N/A	Input buffer and PLL power supply.
ADC_GND	Dedicated	N/A	Analog ground for the ADC.
ADC_SUB_GND	Dedicated	N/A	Digital ground for the ADC.
ADC_CLK_[P or N]	Dedicated	Input	External reference clock for PLL or ADC direct sampling clock input.
VCM01/VCM23	Dedicated	N/A	ADC common mode voltage.
ADC_VIN_[0 to 3]_[P or N]	Dedicated	Input	Analog input signal to the ADC.
ADC_REXT	Dedicated	N/A	ADC external resistor.
DAC_AVCC	Dedicated	N/A	Core DAC and PLL power supply.
DAC_AVCCAUX	Dedicated	N/A	DAC and PLL power supply.
DAC_AVTT	Dedicated	N/A	Termination voltage for on-die 50Ω termination resistors.
DAC_GND	Dedicated	N/A	Analog ground for the DAC.
DAC_SUB_GND	Dedicated	N/A	Digital ground for the DAC.
DAC_CLK_[P or N]	Dedicated	Input	External reference clock for PLL or DAC direct sampling clock input.
SYSREF_[P or N]	Dedicated	Input	External reference clock/trigger for synchronizing timing of the data converters.
DAC_VOUT[0 to 3]_[P or N]	Dedicated	Output	Analog output signals from the DAC.
DAC_REXT	Dedicated	Input	DAC external resistor.

Table 1-4: Pin Definitions (Cont'd)

Pin Name	Type	Direction	Description
Other Dedicated Pins			
DXN	Dedicated	N/A	Temperature-sensing diode pins (Anode: DXP; Cathode: DXN). The thermal diode is accessed by using the DXP and DXN pins. When not used, tie to GND.
DXP			To use the thermal diode an appropriate external thermal monitoring IC must be added. Consult the external thermal monitoring IC data sheet for usage guidelines.

Notes:

1. See the DCI sections in *UltraScale Architecture SelectIO Resources User Guide* (UG571) [Ref 6] for more information on the VRP pins.
2. V_{CCO} pins in unbonded banks must be connected to the V_{CCO} for that bank (for package migration). Do NOT connect unbonded V_{CCO} pins to different supplies. Without a package migration requirement, V_{CCO} pins in unbonded banks can be tied to a common supply (V_{CCO} or GND).
3. See the *UltraScale Architecture System Monitor User Guide* (UG580) [Ref 13] for the default connections required to support on-chip monitoring.
4. L (left), R (right), N (north), and S (south) signify the GT transceiver quad power supply groups.

Footprint Compatibility between Packages

Zynq UltraScale+ devices are footprint compatible only with other Zynq UltraScale+ devices with the same number of package pins and the same preceding alphabetic designator. For example, XCZU9EG-FFVB1156 is compatible with the XCZU15EG-FFVB1156, but not with the XCZU9EG-FFVC900. Pins that are available in one device but are not available in another device are labeled as *No Connects* in the other device's package file.

IMPORTANT: Footprint compatibility does not necessarily imply that all pins will function in the same manner for different devices in a package. For limitations and guidelines on designing for footprint compatible packages, refer to the *Migration Between the Zynq UltraScale+ Devices and Packages* section of *UltraScale Architecture PCB and Pin Planning User Guide (UG583)* [Ref 14].

Table 1-5 shows the footprint compatible devices available for each package. See the *Zynq UltraScale+ MPSoC Overview (DS891)* [Ref 1] for specific package letter code options. All packages are available with eutectic BGA balls. For these packages, the device type is XQ and the Pb-free signifier in the package name is a Q.

Many Zynq UltraScale+ devices that are footprint compatible in a package have different I/O bank and transceiver quad numbers connected to the same package pins. Due to these differences, when migrating between devices in a specific package, the type of bank (HD vs. HP) or quad (PS-GTR, GTH, or GTY), whether a bank is connected or NC at the package pins, and where the bank or quad is located on the die must be taken into consideration. [Table 1-6](#) and [Table 1-7](#) show how the banks and transceiver quads are numbered between devices in each package.

For all grouped-together footprint-compatible packages, the bank and quad numbers in the same column (indicated by the letters A through Z) for each device are connected to the same package pins. For example, in the FFVB1517 packages, bank 88 for the XCZU11 is connected to the same pins as bank 90 for the XCZU17 and XCZU19.

A limited number of HP I/O banks have fewer than 52 SelectIO pins. For a visual representation of all of this information, see the [Die Level Bank Numbering Overview](#) section.

Table 1-6: I/O Bank Migration (HD Banks are Shaded)

Notes:

1. An alphabetical designator, A through Z, is assigned to every bank in a package. I/Os from banks with the same designator are bonded out to the same pins in that package. For example, in the FFVF1517 package, the E designator is assigned to bank 67 for the XCZU11 and bank 64 for the XCZU7. These banks are bonded to the same pins, regardless of where they appear on the XCZU11 and XCZU7 device.
2. Bank 66 is partially bonded out in the SBVA484 package (see [Figure 1-3](#)).

For each grouped set of footprint compatible packages listed in [Table 1-7](#), there is a row detailing the power supply group for each Quad. These groups are labeled according to the regions for the transceiver power supply pins, as listed in the [ASCII Pinout Files](#) linked from [Chapter 3, Package Files](#). For a visual representation of all of this information, see the [Die Level Bank Numbering Overview](#) section.

Notes:

1. An alphabetical designator, A through Z, is assigned to every Quad in a package. Transceivers from Quads with the same designator are bonded out to the same pins in that package. For example, in the FFVF1517 package, the E designator is assigned to Quad 228 for the XCZU11 and Quad 227 for the XCZU7. These Quads are bonded to the same pins, regardless of where they appear on the XCZU11 and XCZU7 device.

Die Level Bank Numbering Overview

Banking and Clocking Summary

- For each device, not all banks are bonded out in every package.

GTH/GTY Columns

- One GT Quad = Four transceivers = Four GTHE4 or GTYE4 primitives.
- Not all GT Quads are bonded out in every package.
- Also shown are quads labeled with RCAL. This specifies the location of the RCAL masters for each device. With respect to the package, the RCAL masters are located on the same package pin for each package, regardless of the device.
- The XY coordinates shown in each quad correspond to the transceiver channel number found in the pin names for that quad, as shown in [Figure 1-2](#).
- An alphabetic designator is shown in each quad. Each letter corresponds to the columns in [Table 1-6](#) and [Table 1-7](#).
- The power supply group is shown in brackets [] for each quad.

I/O Banks

- Each user HP I/O bank has a total of 52 I/Os where 48 can be used as differential (24 differential pairs) or single-ended I/Os. The remaining four function only as single-ended I/Os. All 52 pads of a bank are not always bonded out to pins.
- A limited number of HP I/O banks have fewer than 52 SelectIO pins. These banks are labeled as partial.
- Each user HD I/O bank has a total of 24 I/Os that can be used as differential (12 differential pairs) or single-ended I/Os.
- Adjacent to each bank is a physical layer (PHY) containing a CMT and other clock resources.
- Adjacent to each bank and PHY is a tile of logic resources that makes up a clock region.
- Banks are arranged in columns and separated into rows which are pitch-matched with adjacent PHY, clock regions, and GT blocks.
- An alphabetic designator is shown in each bank. Each letter corresponds to the columns in [Table 1-6](#) and [Table 1-7](#).

Clocking

- Each bank has four pairs of global clock (GC or HDGC) inputs for four differential or four single-ended clock inputs. Single-ended clock inputs should be connected to the P-side of the differential pair.
- Clock signals are distributed through global buffers driving routing and distribution networks to reach any clock region, I/O, or GT.
- Global clock inputs can connect to an MMCM and two PLLs within the horizontally adjacent CMT.

Bank Locations of Dedicated and Multi-Function Pins

- All dedicated configuration I/Os and HD I/Os are 3.3V capable.

Processor (PS) Blocks

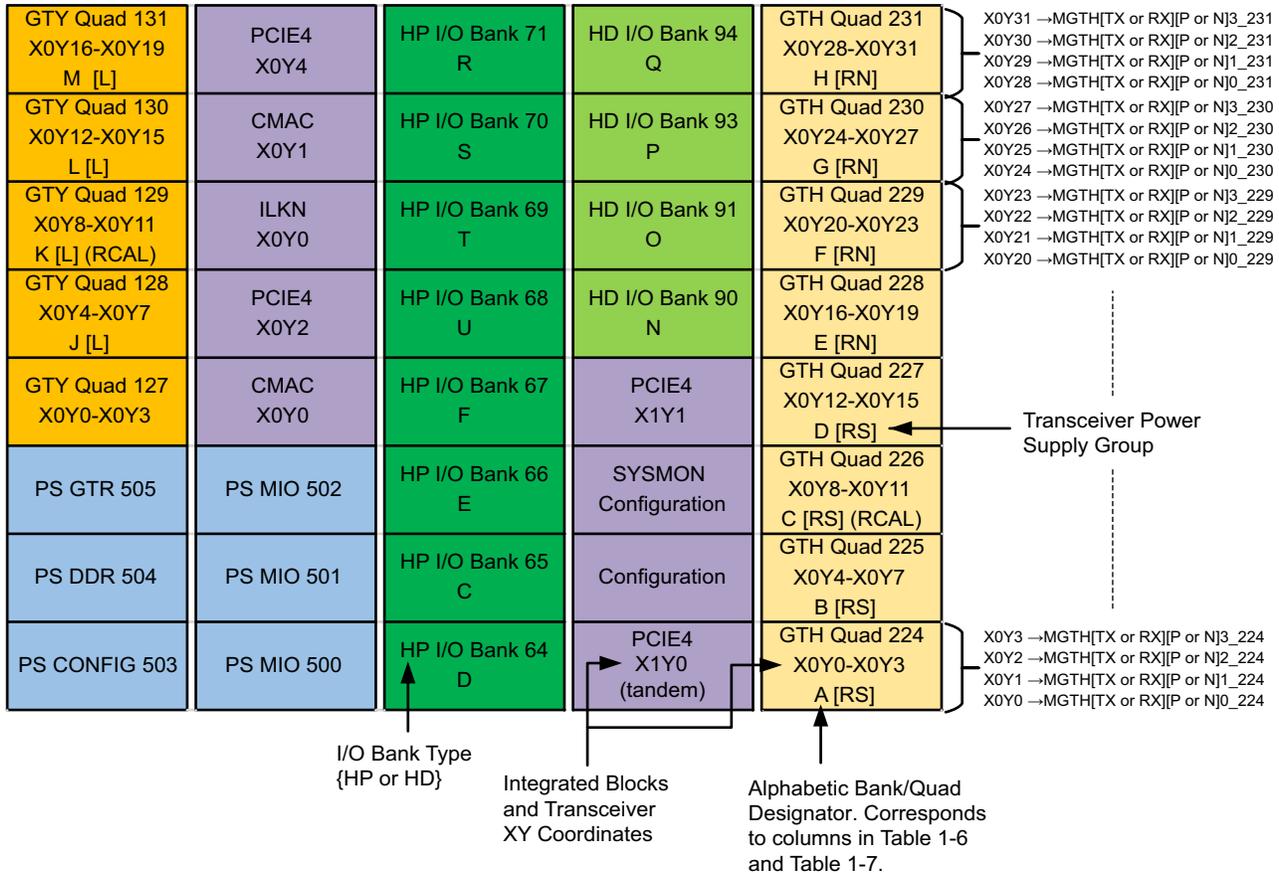

- MIO pins are shared between banks 500, 501, and 502.
- Configuration pins are in bank 503.
- DDR memory pins are in bank 504.
- Transceiver pins are in the PS-GTR quad 505.

SYSMON, Configuration, PCIe, Interlaken, and 100GE Integrated Blocks

- Configuration: Configuration block.
- SYSMON/Configuration: Block shared between the SYSMONE4 and configuration.
- PCIe: Integrated block for PCIe.
Note: PCIe blocks with an additional (Tandem) label support tandem configuration.
- ILKN: Interlaken block.
- CMAC: 100G Ethernet block.

Device Diagrams

Figure 1-1 shows an example diagram with a brief explanation for each component.

PS Memory Interface Pin Guidelines

Introduction to PS Memory Interface Pins

This chapter shows what is needed to support the broad requirements of various memory interfaces using the Zynq® UltraScale+™ device DDR subsystem. It covers DDR3/3L, DDR4, LPDDR4, and LPDDR3.

IMPORTANT: *SBVA484 and SFVA625 packages only support 32-bit data buses for the PS DDR controller. The Zynq UltraScale+ device DDR subsystem can only be configured for 32-bit or 32-bit plus ECC DDR3/DDR4/LPDDR4 designs when using these packages.*

DDR3/3L Guidelines

DDR3/3L Pin Rules

The DDR3/3L pin rules are for single and dual-rank memory interfaces.

- All unused DDR pins can be left unconnected. For example, in a 64-bit interface without ECC, the PS_DDR_DQ64 to PS_DDR_DQ71, PS_DDR_DQS_P8/N8, and PS_DDR_DM8 pins can be left unconnected.
- Connect the PS_DDR_ZQ pin to GND using a 240Ω resistor. There should be separate 240Ω resistors at the MPSoC or RFSoc and at the DRAM.

DDR3/3L Pin Swapping Restrictions

- Address/command/control bits cannot be swapped.
- DQ byte lane swapping is allowed. A byte lane includes any signals associated with the aligned 8-bits of DQ, such as DM, DQS, DQS_N, and DQ signals.
- DQ bits swapping within a byte lane is allowed.

DDR3/3L Pinout Example for Supported Configurations

Table 2-1 shows a pinout example for the DDR3/3L supported configurations. For termination details, see the *UltraScale Architecture PCB Design Guide* [Ref 14]. When not being used for a memory interface, all pins should be left unconnected with the exception of VCCO_PSDDR and VCC_PSDDR_PLL, which should be tied to GND.

IMPORTANT: *VCC_PSINTFP must be tied to VCC_PSINTFP_DDR. This requirement is in Zynq UltraScale+ MPSoC Data Sheet: DC and AC Switching Characteristics [Ref 8] and Zynq UltraScale+ RFSoc Data Sheet: DC and AC Switching Characteristics [Ref 9], where both VCC_PSINTFP and VCC_PSINTFP_DDR must be connected to the same supply and thus both must be powered to avoid MBIST failure.*

Table 2-1: DDR3/3L Supported Pinout Configurations

Pin Name	DDR3/3L 64-bit 1Rank	DDR3/3L 64-bit 2Rank	DDR3/3L 32-bit 1Rank	DDR3/3L 32-bit 2Rank
VCCO_PSDDR ⁽¹⁾	Set to 1.5V (1.35V for DDR3L)			
PS_DDR_A0 to PS_DDR_A15	Connect A0 to PS_DDR_A0, A1 to PS_DDR_A1, and so on.	Connect A0 to PS_DDR_A0, A1 to PS_DDR_A1, and so on.	Connect A0 to PS_DDR_A0, A1 to PS_DDR_A1, and so on.	Connect A0 to PS_DDR_A0, A1 to PS_DDR_A1, and so on.

Table 2-1: DDR3/3L Supported Pinout Configurations (Cont'd)

Pin Name	DDR3/3L 64-bit 1Rank	DDR3/3L 64-bit 2Rank	DDR3/3L 32-bit 1Rank	DDR3/3L 32-bit 2Rank
PS_DDR_ZQ	Connect a 240Ω resistor to GND. ⁽²⁾			

Notes:

- For VCCO_PSDDR decoupling guidelines, see the *UltraScale Architecture PCB Design Guide* [Ref 14].
- There should be separate 240Ω resistors at the FPGA and at the DRAM.

DDR4 Guidelines

DDR4 Pin Rules

The DDR4 pin rules are for single and dual-rank memory interfaces.

- All unused DDR pins can be left unconnected. For example, in a 64-bit interface without ECC, the PS_DDR_DQ64 to PS_DDR_DQ71, PS_DDR_DQS_P8/N8, and PS_DDR_DM8 pins can be left unconnected.
- The PS_DDR_ALERT_N can be left floating at the DRAM. For component interfaces, connect the PS_DDR_ALERT_N pin to the ALERT_N pins of the DDR4 devices in fly-by routing, and terminate to V_{DD} with a 50Ω pull-up resistor. For DIMM designs, connect the PS_DDR_ALERT_N pin to the ALERT_N pin of the connector.
- Connect the PS_DDR_ZQ pin to GND using a 240Ω resistor. There should be separate 240Ω resistors at the FPGA and at the DRAM.
- Component interfaces with the same component for all components in the interface. The x16 components have a different number of bank groups than the x8 components. For example, create a 72-bit wide component interface by using nine x8 components or five x16 components, where half of one component is not used. Creating four x16 components and one x8 component is not permissible.

DDR4 Pin Swapping Restrictions

- Address/command/control bits cannot be swapped.
- DQ byte lane swapping is allowed. A byte lane includes any signals associated with the aligned 8-bits of DQ, such as DM, DQS, DQS_N, and DQ signals.
- DQ bits swapping within a byte lane is allowed.

DDR4 Pinout Example for Supported Configurations

Table 2-2 shows a pinout example for the DDR4 supported configurations. For termination details, see the *UltraScale Architecture PCB Design Guide* [Ref 14]. When not being used for a memory interface, all pins should be left unconnected with the exception of VCCO_PSDDR and VCC_PSDDR_PLL, which should be tied to GND.

IMPORTANT: VCC_PSINTFP must be tied to VCC_PSINTFP_DDR. This requirement is in *Zynq UltraScale+ MPSoC Data Sheet: DC and AC Switching Characteristics* [Ref 8] and *Zynq UltraScale+ RFSoc Data Sheet: DC and AC Switching Characteristics* [Ref 9], where both VCC_PSINTFP and VCC_PSINTFP_DDR must be connected to the same supply and thus both must be powered to avoid MBIST failure.

Table 2-2: DDR4 Supported Pinout Configurations

Pin Name	DDR4 64-bit 1Rank	DDR4 64-bit 2Rank	DDR4 32-bit 1Rank	DDR4 32-bit 2Rank	DDR4 16-bit 1Rank	DDR4 16-bit 2Rank

Connect to GND through a 240Ω resistor. Connect DRAM ZQ pins to VSSQ through a 240Ω resistor.	Connect to GND through a 240Ω resistor. Connect DRAM ZQ pins to VSSQ through a 240Ω resistor.	Connect to GND through a 240Ω resistor. Connect DRAM ZQ pins to VSSQ through a 240Ω resistor.	Connect to GND through a 240Ω resistor. Connect DRAM ZQ pins to VSSQ through a 240Ω resistor.

Notes:

1. For VCCO_PSDDR decoupling guidelines, see the *UltraScale Architecture PCB Design Guide* [Ref 14].
2. The PS_DDR_BG1 pin can be left unconnected when targeting x16 component interfaces without a BG1 pin, but it should always be connected for DIMM applications.

LPDDR4 Guidelines

LPDDR4 Pin Rules

The LPDDR4 pin rules are for single and dual-rank memory interfaces.

- All unused DDR pins can be left unconnected. For example, in an 64-bit interface without ECC, the PS_DDR_DQ64 to PS_DDR_DQ71, PS_DDR_DQS_P8/N8, and PS_DDR_DM8 pins can be left unconnected.
- Connect the PS_DDR_ZQ pin to GND using a 240Ω resistor. There should be separate 240Ω resistors at the FPGA and at the DRAM.
- To achieve maximum performance, address copy mode is suggested.

LPDDR4 Pin Swapping Restrictions

- Command/address bits cannot be swapped.
- To support write DQS to DQ training, DQ byte lane swapping is not allowed.
- To support write DQS to DQ training, DQ bits with bytes 0, 2, and 8 are not allowed to be swapped.
- Bits within bytes 1 and 3 can be swapped.

LPDDR4 Pinout Example for Supported Configurations

Table 2-3 shows a pinout example for the LPDDR4 supported configurations. For termination details, see the *UltraScale Architecture PCB Design Guide* [Ref 14]. When not being used for a memory interface, all pins should be left unconnected with the exception of VCCO_PSDDR and VCC_PSDDR_PLL, which should be tied to GND.

IMPORTANT: *VCC_PSINTFP must be tied to VCC_PSINTFP_DDR. This requirement is in Zynq UltraScale+ MPSoC Data Sheet: DC and AC Switching Characteristics [Ref 8] and Zynq UltraScale+ RFSoc Data Sheet: DC and AC Switching Characteristics [Ref 9], where both VCC_PSINTFP and VCC_PSINTFP_DDR must be connected to the same supply and thus both must be powered to avoid MBIST failure.*

Connect to GND through a 240Ω resistor. Connect DRAM ZQ pins to VDDQ through a 240Ω resistor.	Connect to GND through a 240Ω resistor. Connect DRAM ZQ pins to VDDQ through a 240Ω resistor.

Notes:

1. For VCCO_PSDDR decoupling guidelines, see the *UltraScale Architecture PCB Design Guide* [Ref 14].

LPDDR3 Guidelines

LPDDR3 Pin Rules

The LPDDR3 pin rules are for single and dual-rank memory interfaces.

- All unused DDR pins can be left unconnected. For example, in an 64-bit interface without ECC, the PS_DDR_DQ64 to PS_DDR_DQ71, PS_DDR_DQS_P8/N8, and PS_DDR_DM8 pins can be left unconnected.
- Connect the PS_DDR_ZQ pin to GND using a 240Ω resistor. There should be separate 240Ω resistors at the FPGA and at the DRAM.
- To achieve maximum performance, address copy mode is suggested.

LPDDR3 Pin Swapping Restrictions

- Command/address bits cannot be swapped.
- To support command/address training, DQ byte lane swapping is not allowed.
- To support command/address training, DQ bits swapping within a byte lane is not allowed.

LPDDR3 Pinout Example for Supported Configurations

Table 2-4 shows a pinout example for the LPDDR3 supported configurations. For termination details, see the *UltraScale Architecture PCB Design Guide* [Ref 14]. When not being used for a memory interface, all pins should be left unconnected with the exception of VCCO_PSDDR and VCC_PSDDR_PLL, which should be tied to GND.

IMPORTANT: VCC_PSINTFP must be tied to VCC_PSINTFP_DDR. This requirement is in Zynq UltraScale+ MPSoC Data Sheet: DC and AC Switching Characteristics [Ref 8] and Zynq UltraScale+ RFSoc Data Sheet: DC and AC Switching Characteristics [Ref 9], where both VCC_PSINTFP and VCC_PSINTFP_DDR must be connected to the same supply and thus both must be powered to avoid MBIST failure.

Notes:

1. For VCCO_PSDDR decoupling guidelines, see the *UltraScale Architecture PCB Design Guide* [Ref 14].
2. There should be separate 240Ω resistors at the FPGA and at the DRAM.

Package Files

About ASCII Package Files

The ASCII package files for each Zynq® UltraScale+™ device include a comma-separated-values (CSV) version and a text version optimized for a browser or text editor in fixed-width fonts. The information in each of the files includes:

- Device/Package name (*family-device-package*), with date and time of creation
- Seven columns containing data for each pin:
 - Pin—Pin location on the package.
 - Pin Name—The name of the assigned pin.
 - Memory Byte Group—Memory byte group between 0 and 3 split into upper (U) and lower (L) halves. For more information on the memory byte group, see the *UltraScale Architecture-Based Memory Interface Solutions Product Guide* (PG150) [Ref 15].
 - Bank—Bank number.
 - I/O Type—CONFIG, HD, HP, GTH, GTY, PS-GTR, PSMIO, PSDDR, or PSCONFIG depends on the I/O type. For more information on the I/O type, see the *UltraScale Architecture SelectIO Resources User Guide* (UG571) [Ref 6].
 - Super Logic Region—Number corresponding to the super logic region (SLR) in the devices implemented with stacked silicon interconnect (SSI) technology.
- Total number of pins in the package.

Package Specifications Designations

Package specifications are designated as evaluation only, engineering sample, or production. Each designation is defined as follows.

Evaluation Only

These package specifications are based on initial device specifications, package routability analysis and mechanical package construction. Package specifications with this designation are not stable and package pinouts are likely to change and these specifications should only be used for initial system level design feasibility.

Engineering Sample

These package specifications are based on a released package design and validated with ES engineering sample (ES) devices. Package specifications with this designation are considered stable, however some pinout and mechanical specifications might change prior to the production release of the particular device. Package pinouts with this designation are to be used for PCB and Vivado® designs using ES devices.

Production

These package specifications are released coincident with production release of a particular device. Customers receive formal notification of any subsequent changes.

ASCII Pinout Files

Links to the ASCII pinout information device/package combinations are listed in [Table 3-1](#).

Download all available package/device/pinout files at:

www.xilinx.com/support/package-pinout-files/zynq-ultrascale-plus-pkgs.html

Note: All package files are ASCII files in TXT and CSV file format. Only the available files listed in [Table 3-1](#) are linked and consolidated in this ZIP file:

www.xilinx.com/support/packagefiles/zuppackages/zupall.zip

IMPORTANT: All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC or XA, and the Pb-free signifier in the package name is Q.

Device Diagrams

Summary

The diagrams in this chapter show top-view perspective of the package pinout of each Zynq® UltraScale+™ device/package combination. [Table 4-1](#) is a cross reference to the device/package diagrams. The I/O-bank diagram shows the location of each user I/O, PSMIO, PSDDR, PSCONFIG, and PS-GTR, GTH, and GTY transceiver and the respective bank or GT quad. The configuration-power diagram shows the location of every power pin and dedicated as well as multi-function configuration pin in the package. See [Package Specifications Designations in Chapter 3](#) for definitions of [Evaluation Only](#), [Engineering Sample](#), and [Production](#) device diagrams.

IMPORTANT: All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC or XA, and the Pb-free signifier in the package name is Q.

Mechanical Drawings

Summary

This chapter provides mechanical drawings (package specifications) of the Zynq® UltraScale+™ devices. [Table 5-1](#) and [Table 5-2](#) cross-reference to the mechanical drawings by device and package combination. See [Package Specifications Designations in Chapter 3](#) for definitions of [Evaluation Only](#), [Engineering Sample](#), and [Production](#) mechanical drawings.

IMPORTANT: *All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC or XA, and the Pb-free signifier in the package name is Q. For the mechanical drawings, refer to the Pb-free version of these packages.*

Table 5-3: Mechanical Drawing Dimension Definitions

Dimension	Definition
\ominus	Bilateral tolerance of package sides with respect to datums A and B
\square	Flatness tolerance of silicon die or package lid top surface
//	Bilateral tolerance for parallelism of silicon die or package lid top surface with respect to the seating plane datum C
A	Thickness of package with respect to the seating plane datum C
A ₁	Thickness of BGA balls with respect to the seating plane datum C
A ₂	Thickness of package body, including stiffener ring or lid and excluding BGA balls, with respect to the seating plane datum C
A ₃	Distance from top of silicon die to top of stiffener ring or lid with respect to the seating plane datum C
D/E	Length/width of package with respect to datums A and B
D ₁ /E ₁	Length/width of BGA matrix with respect to datums A and B
e	BGA ball pitch measured at the center of each ball
∅b	BGA ball diameter
\ominus aaa	Unidirectional upward tolerance with respect to the seating plane datum C
// bbb	Bilateral tolerance for parallelism of package surface with respect to the seating plane datum C
∅ddd	BGA ball position tolerance of diameter ddd with respect to datums A and B perpendicular to the seating plane datum C in which the center of each ball must lie
∅eee	BGA ball position tolerance of diameter eee measured with respect to other balls within the BGA matrix in which the center of each ball must lie
M	BGA ball matrix size

Package Marking

Introduction

The package top-markings for the XC and XA Zynq® UltraScale+™ devices are similar to the examples shown in [Figure 6-1](#) and [Figure 6-2](#). In addition to the markings explained in [Table 6-1](#), refer to the *FAQ: Top Marking Change for 7 Series, UltraScale, and UltraScale+ Products* (XTP424) [[Ref 17](#)] and (XTP544) [[Ref 18](#)].

The package top-markings for the XQ Zynq UltraScale+ devices are as shown in [Figure 6-3](#). On XQ products only the Xilinx logo and the 2D bar code are marked.

Table 6-1: XC and XA Device Marking Definition—Example

Item	Definition
Xilinx Logo	Xilinx logo, Xilinx name with trademark, and trademark-registered status.
Family Brand Logo	Device family name with trademark and trademark-registered status. This line is optional and could appear blank.
1st Line	Device name. This line is not marked on some devices. Refer to the bar code for more information.
2nd Line	<p>This line is not marked on some devices. Refer to the bar code for more information.</p> <ul style="list-style-type: none"> Package code: FF 1st digit: F for flip-chip BGA, S for flip-chip BGA with 0.8 mm ball pitch. 2nd digit: F for lidded, B for bare-die. 3rd digit: Pb-free code: V for RoHS 6/6, R or Q for packages with eutectic BGA balls. All Zynq UltraScale+ devices are available with Pb-free RoHS compliant packaging. For more details on Xilinx Pb-free and RoHS compliant products, see: www.xilinx.com/pbfree. 4th digit: This is the pin out (net list) identifier. 5th–8th digits: These are the physical pin count identifiers: B1156 is shown in the Figure 6-2 example marking drawing. Example: A package code of FFVB1517 and FFVF1517 means they have a different pinout (net list) but the same physical ball count and physical dimensions. Three letter circuit design revision, the location code for the wafer fab, and the geometry code (xxx). When marked, the date code: YYWW. This code is not marked on some devices. Refer to the bar code for more information.

Table 6-1: XC and XA Device Marking Definition—Example (Cont'd)

Item	Definition						
3rd Line	When marked, this line describes ten alphanumeric characters for assembly location, 7-digit lot number, and step information. The last digit is usually an A or an M if a stepping version does not exist. This line is not marked on some devices. Refer to the bar code for more information.						
4th Line	When marked, this line describes the device speed grade (1) and temperature operating range (E). When not marked on the package, the product is considered to operate at the extended (E) temperature range. If a bar code is present on the device, the 4th line might be blank or unmarked. In this case, refer to the bar code for speed grade and temperature range information. For more information on the ordering codes, see the <i>Zynq UltraScale+ MPSoC Overview</i> (DS891) [Ref 1]. Other variations for the 4th line: <table border="1" data-bbox="310 636 1482 926"> <tbody> <tr> <td data-bbox="310 636 472 741">L1I</td> <td data-bbox="472 636 1482 741">The L1I indicates a -1LI device. The -1LI speed grade offers reduced maximum power consumption. For more information, see the <i>Zynq UltraScale+ MPSoC data sheet</i> [Ref 8].</td> </tr> <tr> <td data-bbox="310 741 472 821">1E xxxx</td> <td data-bbox="472 741 1482 821">The xxxx indicates a 4-digit SCD device option. An SCD is a special ordering code that is not always marked in the device top mark.</td> </tr> <tr> <td data-bbox="310 821 472 926">1E ES 2I ES L1I ES</td> <td data-bbox="472 821 1482 926">The addition of an ES after the operating temperature range code indicates an engineering sample.</td> </tr> </tbody> </table>	L1I	The L1I indicates a -1LI device. The -1LI speed grade offers reduced maximum power consumption. For more information, see the <i>Zynq UltraScale+ MPSoC data sheet</i> [Ref 8].	1E xxxx	The xxxx indicates a 4-digit SCD device option. An SCD is a special ordering code that is not always marked in the device top mark.	1E ES 2I ES L1I ES	The addition of an ES after the operating temperature range code indicates an engineering sample.
L1I	The L1I indicates a -1LI device. The -1LI speed grade offers reduced maximum power consumption. For more information, see the <i>Zynq UltraScale+ MPSoC data sheet</i> [Ref 8].						
1E xxxx	The xxxx indicates a 4-digit SCD device option. An SCD is a special ordering code that is not always marked in the device top mark.						
1E ES 2I ES L1I ES	The addition of an ES after the operating temperature range code indicates an engineering sample.						
Bar Code	A device-specific bar code is marked on each device. Refer to the <i>FAQ: Top Marking Change for 7 Series, UltraScale, and UltraScale+ Products</i> (XTP424) [Ref 17].						

Packing and Shipping

Introduction

Zynq® UltraScale+™ devices are packed in trays. Trays are used to pack most of Xilinx surface-mount devices since they provide excellent protection from mechanical damage. In addition, they are manufactured using antistatic material to provide limited protection against ESD damage and can withstand a bake temperature of 125°C.

Table 7-1: Standard Device Counts per Tray and Box

Package	Maximum Number of Devices Per Tray	Maximum Number of Units In One Internal Box
SBVA484, SFRA484	84	420
UBVA530	126	630
SFVA625	60	300
SFVC784, SFRC784	60	300
FBVB900, FFVC900, FFRB900, FFRC900	27	135
FFVB1156, FFRB1156, FFVC1156, FFRC1156 FFVD1156, FFRD1156, FFVE1156, FFRE1156	24	120
FSVE1156	24	72
FFVB1517, FFRB1517, FFVF1517	21	105
FFVG1517, FFRG1517	21	63
FSVG1517	21	63
FFVC1760, FFRC1760 FFVD1760, FFVF1760, FFRH1760, FFRF1760	12	60
FSVF1760, FSVH1760	12	36
FFVE1924	12	36

IMPORTANT: All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC or XA, and the Pb-free signifier in the package name is Q (for example: FFQE1156).

Soldering Guidelines

Soldering Guidelines

To implement and control the production of surface-mount assemblies, the dynamics of the solder reflow process and how each element of the process is related to the end result must be thoroughly understood.

RECOMMENDED: *Xilinx recommends that customers qualify their custom PCB assembly processes using package samples.*

The primary phases of the reflow process are:

- Melting the particles in the solder paste
- Wetting the surfaces to be joined
- Solidifying the solder into a strong metallurgical bond

The peak reflow temperature of a surface-mount component body should not be more than 250°C maximum (260°C for dry rework only) for Pb-free packages and 220°C for eutectic packages, and is package size dependent. For multiple BGAs in a single board and because of surrounding component differences, Xilinx recommends checking all BGA sites for varying temperatures.

The infrared reflow (IR) process is strongly dependent on equipment and loading. Components might overheat due to lack of thermal constraints. Unbalanced loading can lead to significant temperature variation on the board. These guidelines are intended to assist users in avoiding damage to the components; the actual profile should be determined by those using these guidelines. For complete information on package moisture / reflow classification and package reflow conditions, refer to the Joint IPC/JEDEC Standard J-STD-020C.

IMPORTANT: *Following the initial reflow process, devices should not be reworked more than once. Any additional rework beyond that is likely to cause irreparable damage to the device.*

Sn/Pb Reflow Soldering

Figure 8-1 shows typical conditions for solder reflow processing of Sn/Pb soldering using IR/convection. Both IR and convection furnaces are used for BGA assembly. The moisture sensitivity of surface-mount components must be verified prior to surface-mount flow.

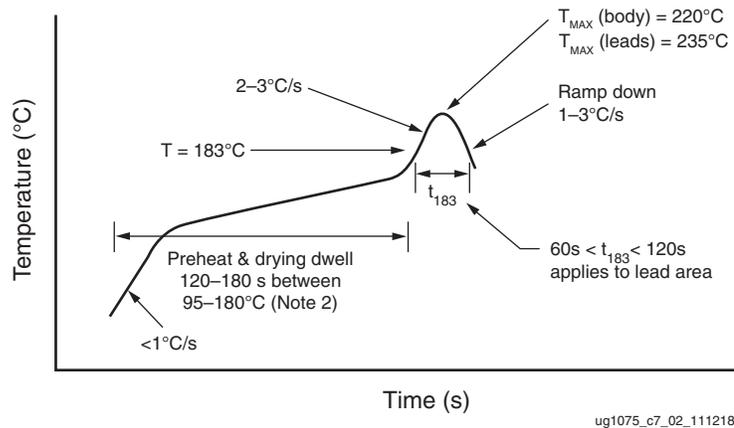

Figure 8-1: Typical Conditions for IR Reflow Soldering of Sn/Pb Solder

Notes for Figure 8-1:

1. Maximum temperature range = 220°C (body). Minimum temperature range before 205°C (leads/balls).
2. Preheat dwell 95–180°C for 120–180 seconds.
3. IR reflow must be performed on dry packages.

Pb-Free Reflow Soldering

Xilinx uses SnAgCu solder balls for commercial-grade (XC) and automotive-grade (XA) BGA packages. In addition, suitable package materials are qualified for the higher reflow temperatures (250°C maximum, 260°C for dry rework only) required by Pb-free soldering processes.

Xilinx does not support soldering SnAgCu BGA packages with SnPb solder paste using a Sn/Pb soldering process. Traditional Sn/Pb soldering processes have a peak reflow temperature of 220°C. At this temperature range, the SnAgCu BGA solder balls do not properly melt and wet to the soldering surfaces. As a result, reliability and assembly yields can be compromised.

The optimal profile must take into account the solder paste/flux used, the size of the board, the density of the components on the board, and the mix between large components and smaller, lighter components. Profiles should be established for all new board designs using thermocouples at multiple locations on the component. In addition, if there is a mixture of devices on the board, then the profile should be checked at various locations on the board. Ensure that the minimum reflow temperature is reached to reflow the larger components and at the same time, the temperature does not exceed the threshold temperature that might damage the smaller, heat sensitive components.

[Table 8-1](#) and [Figure 8-2](#) provide guidelines for profiling Pb-free solder reflow of 0.8 mm and 1.0 mm pitch packages. InFo package guidelines are listed in a separate [Table 8-2](#). In general, a gradual, linear ramp into a spike has been shown by various sources to be the optimal reflow profile for Pb-free solders ([Figure 8-2](#)). This profile has been shown to yield better wetting and less thermal shock than conventional ramp-soak-spike profile for the Sn/Pb system. SnAgCu alloy reaches full liquidus temperature at 235°C. When profiling, identify the possible locations of the coldest solder joints and ensure that those solder joints reach a minimum peak temperature of 235°C for at least 10 seconds. Reflowing at high peak temperatures of 260°C and above can damage the heat sensitive components and cause the board to warp. Users should reference the latest IPC/JEDEC J-STD-020 standard for the allowable peak temperature on the component body. The allowable peak temperature on the component body is dependent on the size of the component. Refer to [Table 8-3](#) for peak package reflow body temperature information. In any case, use a reflow profile with the lowest peak temperature possible.

Table 8-1: Pb-Free Reflow Soldering Guidelines

Profile Feature	Convection, IR/Convection
Ramp-up rate	2°C/s maximum. 1°C/s maximum for lidless packages with stiffener ring.
Preheat temperature 150°–200°C	60–120 seconds.
Temperature maintained above 217°C	60–150 seconds (60–90 seconds typical).
Time within 5°C of actual peak temperature	30 seconds maximum.

Table 8-1: Pb-Free Reflow Soldering Guidelines (Cont'd)

Profile Feature	Convection, IR/Convection
Peak temperature (lead/ball)	230°C—245°C typical (depends on solder paste, board size, component mixture).
Peak temperature (body)	240°C—250°C, package body size dependent.
Ramp-down rate	2°C/s maximum.
Time 25°C to peak temperature	3.5 minutes minimum, 5.0 minutes typical, 8 minutes maximum.

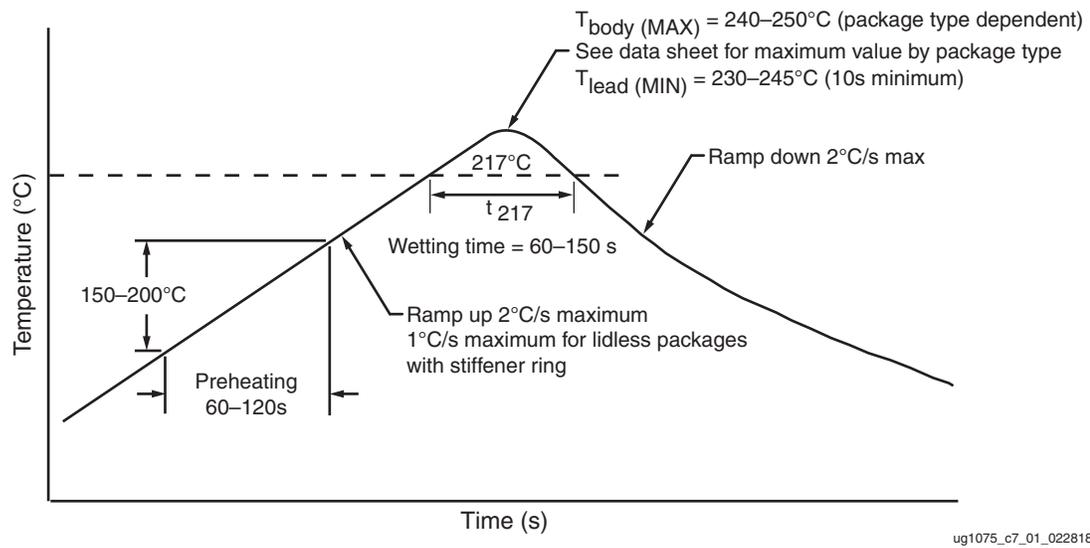

Figure 8-2: Typical Conditions for Pb-Free Reflow Soldering

Table 8-2: InFO Package Reflow Soldering Guidelines

Profile Feature	Convection, IR/Convection
Ramp-up rate	4°C/s maximum
Preheat temperature 150°–190°C	60–100 seconds
Temperature maintained above 217°C	45–75 seconds
Time within 5°C of actual peak temperature	30 seconds maximum
Peak temperature (lead/ball)	230°C—235°C typical (depends on solder paste, board size, component mixture)
Peak temperature (body)	240°C—245°C
Ramp-down rate	2°C/s maximum.
Time 25°C to peak temperature	3.5 minutes minimum, 5.0 minutes typical, 8 minutes maximum.

Peak Package Reflow Temperatures

Table 8-3: Peak Package Reflow Body Temperature (Based on J-STD-020 Standard)

Package	Product Category	Peak Package Reflow Body Temperature	JEDEC Moisture Sensitivity Level (MSL)
SBVA484	XC	Mass reflow: 250°C Dry rework: 260°C	4
SFVA625 SFVC784	XA		3
UBVA530 FBVB900, FFVC900 FFVB1156, FFVC1156 FFVD1156, FFVE1156 FFVB1517, FFVF1517, FFVG1517 FFVC1760, FFVD1760, FFVF1760, FFVH1760 FFVE1924	All	Mass reflow: 245°C Dry rework: 260°C	4
FSVE1156 FSVG1517 FSVF1760, FSVH1760	All	Mass reflow: 240°C Dry rework: 260°C	4
SFRA484, SFRC784 FFRB900, FFRC900 FFRB1156, FFRC1156 FFRD1156, FFRE1156 FFRB1517, FFRG1517 FFRC1760, FFRF1760	XQ ⁽¹⁾	Mass reflow: 220°C Dry rework: 235°C	4

Notes:

1. For devices with the Pb-free signifier in the package name (labeled as Q vs. V) use the temperatures and MSL listed for the XQ product category.

For sophisticated boards with a substantial mix of large and small components, it is critical to minimize the ΔT across the board ($<10^{\circ}\text{C}$) to minimize board warpage and thus, attain higher assembly yields. Minimizing the ΔT is accomplished by using a slower rate in the warm-up and preheating stages. Xilinx recommends a heating rate of less than 1°C/s during the preheating and soaking stages, in combination with a heating rate of not more than 3°C/s throughout the rest of the profile.

It is also important to minimize the temperature gradient on the component, between top surface and bottom side, especially during the cooling down phase. The key is to optimize cooling while maintaining a minimal temperature differential between the top surface of the package and the solder joint area. The temperature differential between the top surface of the component and the solder balls should be maintained at less than 7°C during the critical region of the cooling phase of the reflow process. This critical region is in the part of the cooling phase where the balls are not completely solidified to the board yet, usually

between the 200°C–217°C range. To efficiently cool the parts, divide the cooling section into multiple zones, with each zone operating at different temperatures.

The optimal profile must take into account the solder paste/flux used, the size of the board, the density of the components on the board, and the mix between large components and smaller, lighter components. Profiles should be established for all new board designs using thermocouples at multiple locations on the component. In addition, if there is a mixture of devices on the board, then the profile should be checked at various locations on the board, as shown in [Figure 8-3](#) and [Figure 8-4](#). Ensure that the minimum reflow temperature is reached to reflow the larger components and at the same time, the temperature does not exceed the threshold temperature that might damage the smaller, heat sensitive components.

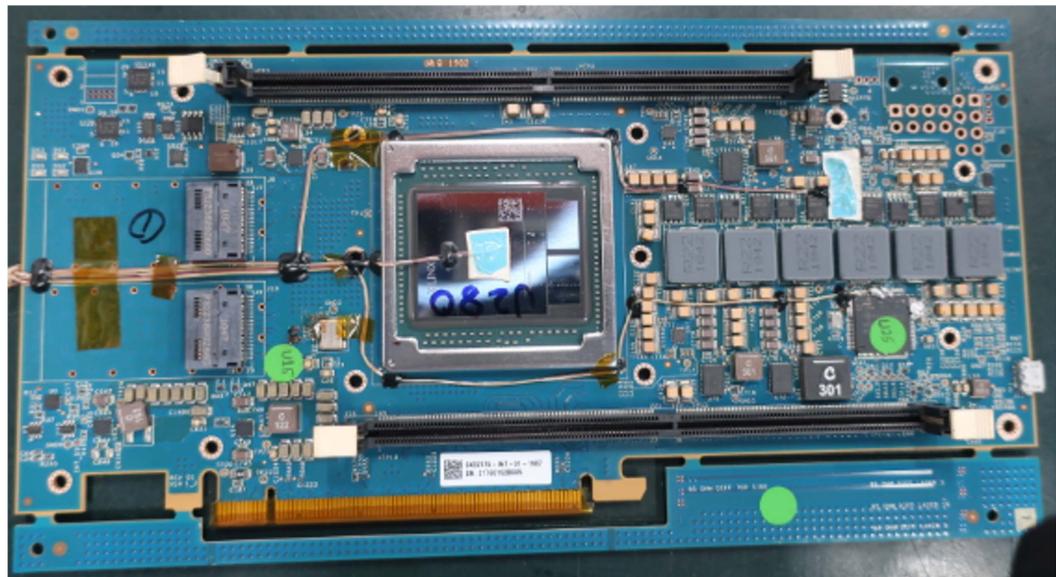

Figure 8-3: Thermocouple Top

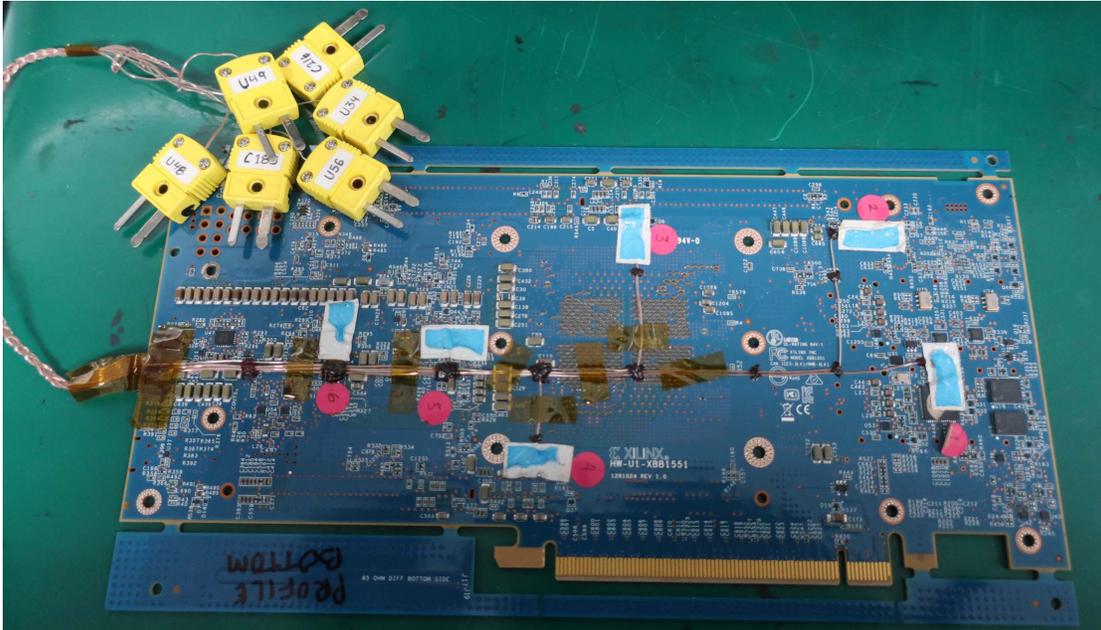

Figure 8-4: Thermocouple Bottom

Post Reflow/Cleaning/Washing

Many PCB assembly subcontractors use a no-clean process in which no post-assembly washing is required. Although a no-clean process is recommended, if cleaning is required, Xilinx recommends a water-soluble paste and a washer using a deionized-water. Baking after the water wash is recommended to prevent fluid accumulation.

Cleaning solutions or solvents are not recommended because some solutions contain chemicals that can compromise the lid adhesive, thermal compound, or components inside the package.

Conformal Coating

Xilinx does not have information regarding the reliability of flip-chip BGA packages on a board after exposure to any specific conformal coating process. Therefore, any process using conformal coating should be qualified for the specific use case to cover the materials and process steps.

Ruggedized XQ packages are designed to support conformal coating, with vented lids that ensure proper cleaning can occur after the etching process and prior to conformal coating.

RECOMMENDED: When a conformal coating is required, Parylene-based material should be used to avoid potential risk of weakening the lid or stiffener ring adhesive used in Xilinx packages.

Strain Gauge Measurement

Strain gauge measurements are recommended to be done at each process step that has the potential to cause excessive board flexing leading to solder joint cracking. Assembly processes where strain gauge measurements are recommended include:

- PCB Router (during PCB loading/unloading into fixture and during the routing process)
- PTH solder assembly during top-catch loading/unloading
- Press fit assembly during press base and tooling loading/unloading and during machine pressing process
- DIMM memory (during PCB loading/unloading and during insertion/removal of DIMM)
- Heat-sink assembly process (during PCB loading/unloading and during entire screw assembly process)
- X-ray fixture (during PCBA loading/unloading)

Strain gauge measurements should be in the range of ± 500 μ strain. Dye and pry analysis is required to confirm if the measured strain causes solder joint cracking. It is recommended to conduct dye and pry analysis for any strain reading greater than 500 μ strain.

To reduce the affects of strain on a device, edge bonding can be used and is recommended for larger packages. See [Edge Bonding Guidelines](#) for implementation details.

Solder Paste

Solder paste consists of solder alloy and a flux system. A typical solder paste composition by volume is split between about 50% alloy and 50% flux. The metal load mass (solder alloy powder) is around 90%, with the remaining 10% mass a flux system. The primary purpose of the flux system is to remove the contaminations from the solder joints during the soldering process. The capability of removing contaminations is determined by the activation level of the type of solder paste. The preferred solder paste metal alloy has a lead-free composition (SnAgCu where Ag is 3–4% and Cu is 0.5–1%). A *no-clean* solder paste is preferred to eliminate any risk of improper cleaning that could leave active residue beneath the device and other BTC components. The paste must be suitable for printing the solder stencil aperture dimensions. Type 4 paste is recommended for better paste release performance. When using a solder paste, you must adhere to the handling recommendations of the paste manufacturer.

Component Placement

IMPORTANT: *The following component placement guidelines apply to all package types included in this guide (lidded, lidless, bare-die, etc.).*

Xilinx device packages must be placed accurately according to their geometry outline. Positioning packages manually via hand mounting is not recommended.

Typical component placement accuracies of $\pm 50 \mu\text{m}$ can be achieved using standard pick and placement machine equipment with vision system. The PCB and the components are optically checked and measured and the components are placed on the PCB in specific programmed positions based on the PCB CAD information. The pick and placement machine vision system detects the fiducials on the PCB immediately prior to mounting the FPGA. Recognition of the packages is performed by the vision system, to ensure correct centering of the FPGA placement on the PCB pad array.

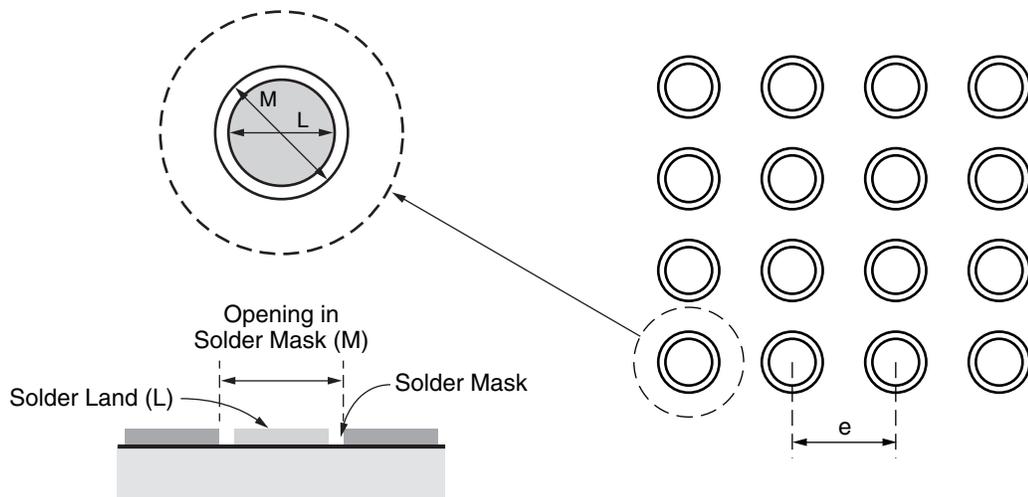

BGA packages with solder balls can self-align during the reflow process because of the solder high surface tension that enables the pulling and centering of the device, and where a slight offset of the placement is still allowed. For guidance, the maximum tolerable offset of device placement is around 30% of the pad diameter on the PCB for typical non-solder mask defined pads. This means that for device packages the solder ball to PCB pad misalignment must be better than $150 \mu\text{m}$ to assure a robust mounting process. Generally, this is achievable using a wide range of modern pick and placement systems. The following setup conditions are important for the pick and placement systems:

- The pick and placement nozzle type should be sized to the dimensions of the Xilinx device. The nozzle needs to firmly hold the device package during the pick and placement stage. The appropriate nozzle type for the device package can be chosen from the manual provided by the pick and placement equipment company.
- The ball recognition capabilities of the placement system should be used and package outline centering should be avoided. This eliminates the solder ball to package edge tolerances of the package. Refer to the specific package outline drawing for details.
- To ensure the proper identification of the device package by the vision system, a suitable lighting system and the correct choice of the features of the measuring method are essential. The most suitable settings can be chosen from the manual provided by the pick and placement equipments company.
- To avoid solder bridging or solder smear, ensure the proper placement force of the device package during placement on the PCB. Excessive placement force can lead to excess solder paste and cause solder bridging. However, a slight placement force can lead to insufficient solder paste contact between the device package solder balls and the solder paste, causing solder defects including open solder joints, badly centered packages, or even head-in-pillow (HIP) defects.

Recommended PCB Design Rules for BGA Packages

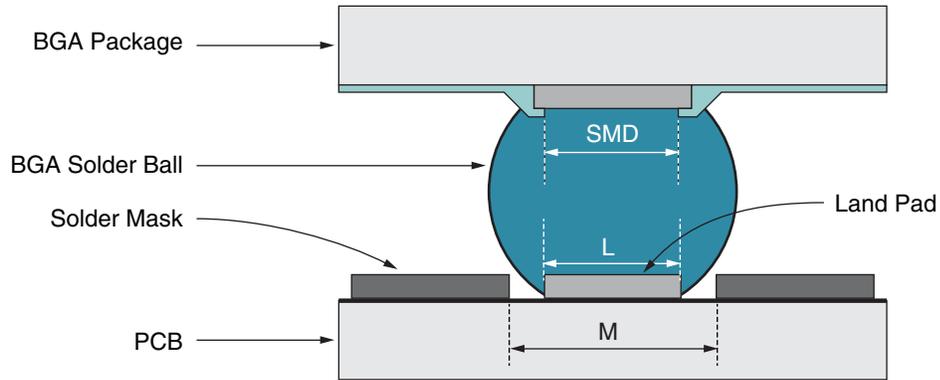

BGA Packages

Xilinx provides the diameter of a land pad on the package side. This information is required prior to the start of the board layout so the board pads can be designed to match the component-side land geometry. The typical values of these land pads are described in [Figure 9-1](#) and summarized in [Table 9-1](#) for 1.0 mm pitch packages. For Xilinx BGA packages, non-solder mask defined (NSMD) pads on the board are suggested to allow a clearance between the land metal (diameter L) and the solder mask opening (diameter M) as shown in [Figure 9-1](#). An example of an NSMD PCB pad solder joint is shown in [Figure 9-2](#). It is recommended to have the board land pad diameter with a 1:1 ratio to the package solder mask defined (SMD) pad for improved board level reliability. The space between the NSMD pad and the solder mask as well as the actual signal trace widths depend on the capability of the PCB vendor. The cost of the PCB is higher when the line width and spaces are smaller.

UG1075_c8_01_101315

Figure 9-1: Suggested Board Layout of Soldered Pads for BGA Packages

UG1075_c8_02_101315

Figure 9-2: Example of an NSMD PCB Pad Solder Joint

Table 9-1: BGA Package Design Rules

Flip-Chip BGA Packages	1.0 mm Pitch	0.8 mm Pitch	0.5 mm Pitch
Design Rule	Dimensions in mm (mils)		
Package land pad opening (SMD)	0.53 mm (20.9 mils)	0.40 mm (15.7 mils)	0.28 mm (11.0 mils)
Maximum PCB solder land (L) diameter	0.53 mm (20.9 mils)	0.40 mm (15.7 mils)	0.26 mm (10.2 mils)
Opening in PCB solder mask (M) diameter	0.63 mm (24.8 mils)	0.50 mm (19.7 mils)	0.36 mm (14.2 mils)
Solder ball land pitch (e)	1.00 mm (39.4 mils)	0.80 mm (31.5 mils)	0.50 mm (19.7 mils)

Notes:

1. Controlling dimension in mm.

Stencil

Solder paste is applied to PCB metal pads by screen printing. The volume of the printed solder paste is determined by the stencil aperture and the stencil thickness. In most cases, the thickness of a stencil must be matched to the needs of all components on the PCB. Stencil apertures should be a circular shape. To ensure a uniform and high-solder paste transfer to the PCB, laser-cut stencil, made from mostly stainless steel, is typically used. Nickel blank stencils, referring to stencils where the entire foil is laser-cut from a sheet of pure nickel material, can also be used. However, high-quality nano-coated stencils (laser cut from stainless steel) can perform as well as or better than nickel blanks.

Uniform Stencil Aperture Design

- For packages with 1 mm or 0.8 mm ball pitch, a uniform stencil aperture opening of 19.7 mils to 20.0 mils round is recommended.
- For InFO packages with 0.5 mm ball pitch, a uniform stencil with squared aperture openings (rounded corners) of 12 mils and pitch of 19.8 mils, as show in [Figure 9-3](#) is recommended. A stencil thickness of 4 mils is also recommended.

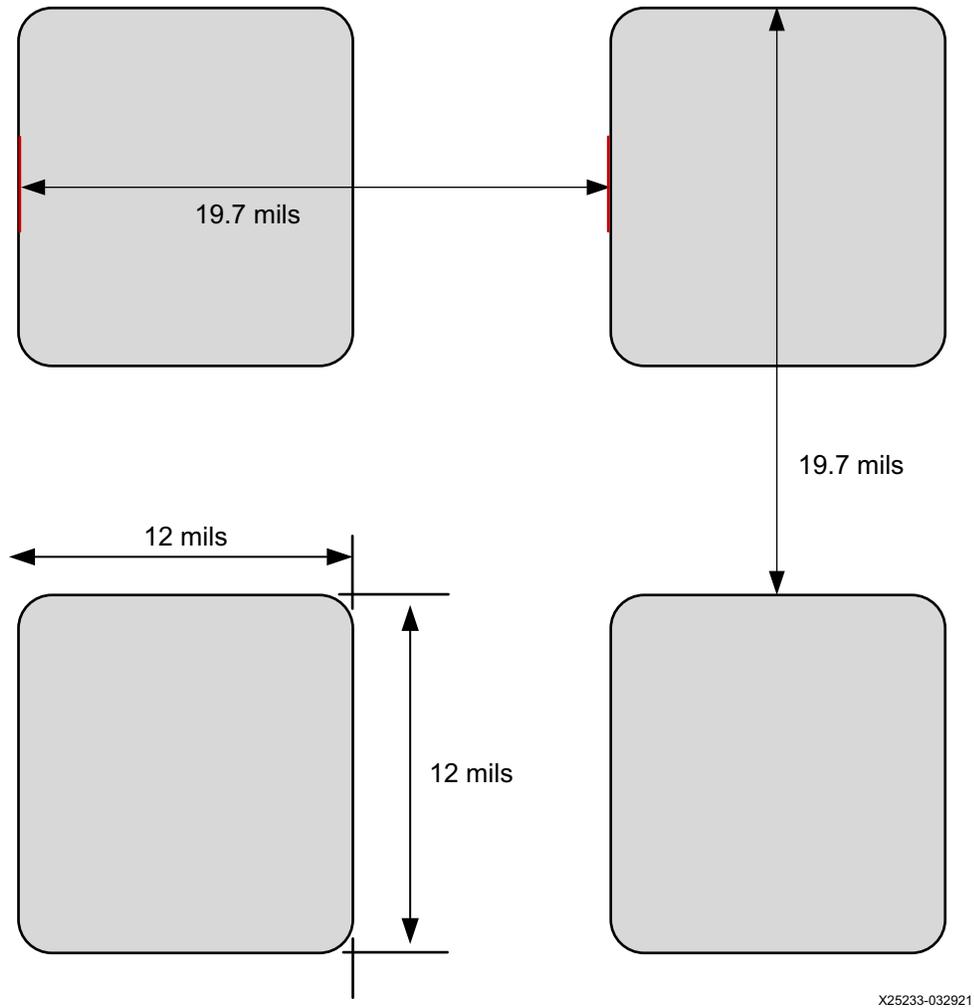

Figure 9-3: Recommended Stencil Design for InFO Packages

Edge Bonding Guidelines

Summary

The edge bonding technique uses high-adhesion adhesives dispensed along the periphery of a component, as shown in [Figure 10-1](#). Xilinx recommends edge bonding for InFO packages (e.g., UBVA530) for increased mechanical reliability.

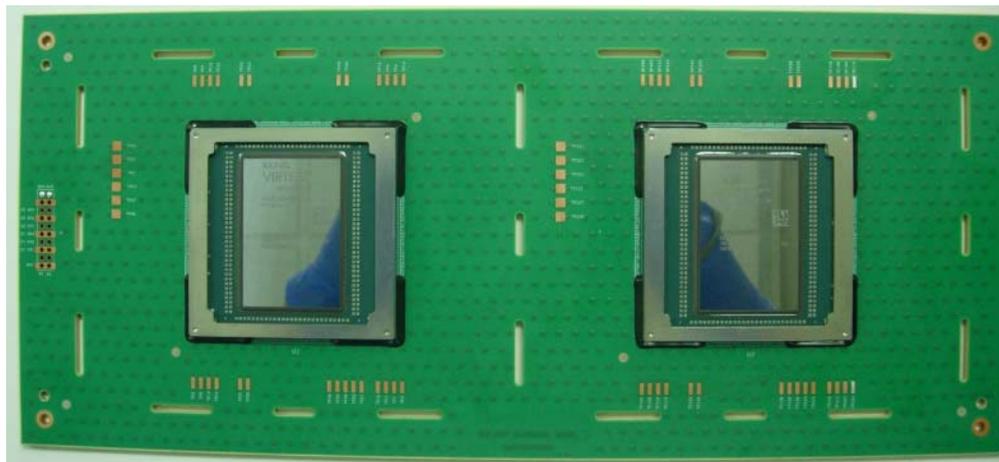

Figure 10-1: Edge Bonded BGA Packages

Various edge-bonding adhesive patterns were evaluated using an in-line dispensing machine. Based on the evaluation, the dispensing pattern shown in [Table 10-1](#) is recommended. A dot pattern, shown in [Figure 10-2](#), has also been successfully evaluated following the same parameters (dot locations at L1 and L2) as the recommended dispensing pattern.

Table 10-1: Edge Bonding Pattern and Parameters

Dimension	UBVA530
Length (L1)	5.6 mm
Length (L2)	3.2 mm
Width (W)/Dot (Size)	1 mm
Height (% of body height)	50 - 90%

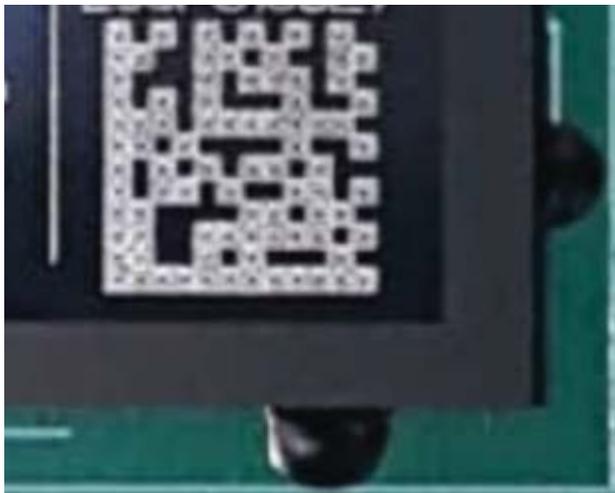

Figure 10-2: Dot Pattern

Edge Bonding Implementation

Edge bonding is the dispensing of an epoxy material around the periphery of the package after board mount. Xilinx requires the use of the [Zymet UA-2605-B](#) edge-bonding material.

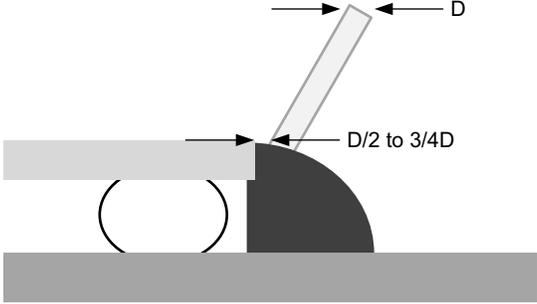

Edge bonding is not intended to under fill the package or contact the solder balls. This technique allows for component rework and improves the robustness of the mounted component by controlling the expansion and warpage of the board during normal operating conditions

To place the adhesive while using an in-line soldering robot, Xilinx recommends the parameters shown in [Table 10-2](#).

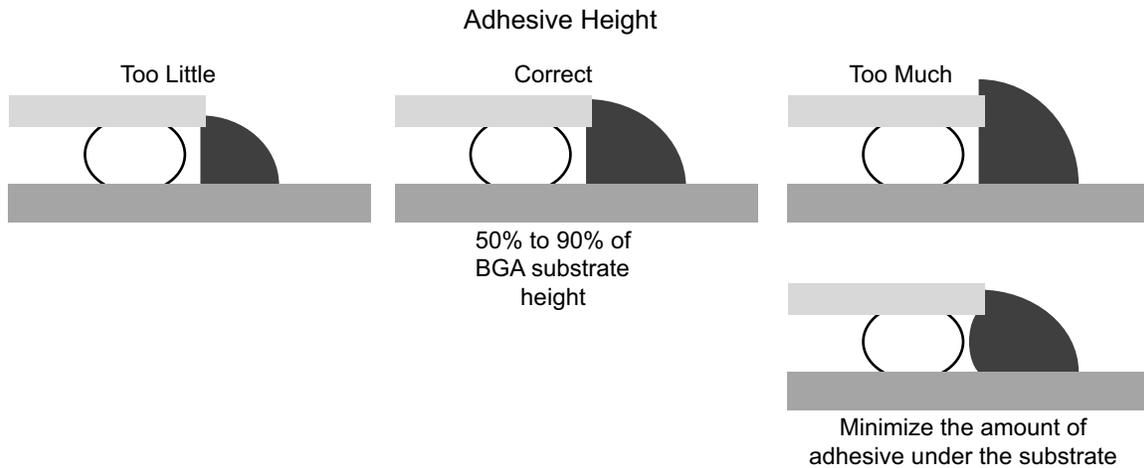

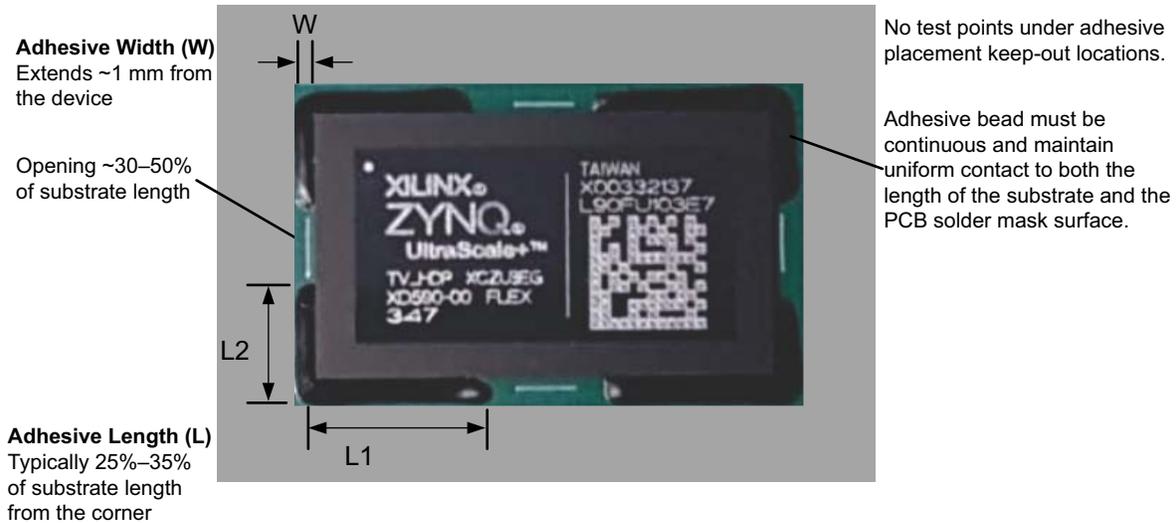

Table 10-2: Process Parameters for Edge Bonding

Process Parameter	Range Specification
Needle size	25—20 gauge
Needle height	Above the device edge midpoint, or 0 to 1.5 mm below the device top surface

Table 10-2: Process Parameters for Edge Bonding (Cont'd)

Process Parameter	Range Specification
Needle edge spacing	Half to three quarters of the needle outer diameter (D)  <p style="text-align: right; font-size: small;">X23147-090519</p>
Dispense needle speed	0.1 to 200 mm/second (typical 15 mm/sec)
Valve pressure	20 to 60 psi (typical 25 psi)

The adhesive is dispensed along the perimeter of the assembled component at a width of 3 mm and a height of 50% to 90% the substrate height, leaving a small section at the center of each edge unbonded, as illustrated in Figure 10-3. This is to ensure that there is an outlet for any expansion of the air during processing. Xilinx recommends centering the opening on each side with a width of 25–30% the length of the package substrate. The exact locations and size of the openings can be varied depending on the design and rework.

X25244-040821

Figure 10-3: Edge Bonding Adhesive Placement Parameters

RECOMMENDED: Curing conditions are 155°C for 10 minutes.

Component Clearance Surrounding Edge Bond

An adjacent component clearance surrounding the Xilinx device is necessary to have the 30° to 45° angle required by the for the edge bond dispenser to dispense the edge bond adhesive material. The surrounding component height and distance from the device is validated based on each unique product design layout.

Edge Bond Removal

Edge bond material can be removed by heating to 170–180°C, and scraping using a stiff probe made of stable organic material such as a non-resinous wood or Teflon. Use a hot air blower on the edge bond area and slowly remove the edge bond adhesive from side to side. Do not use force to remove the edge bond adhesive. Excess adhesive on the PCB can be removed using a chisel-tip soldering iron, with sufficient precautions to limit damage to the PCB surface.

Thermal Specifications

Introduction

Zynq® UltraScale+™ devices are offered exclusively in thermally efficient flip-chip BGA packages. These flip-chip packages range in pin-count from the smaller 19 x 19 mm SBVA484 to the 45 x 45 mm FFVE1924. This suite of packages is used to address the various power requirements of the Zynq UltraScale+ devices. Zynq UltraScale+ devices are implemented in the 16 nm process technology.

Unlike features in an ASIC, the combination of Zynq UltraScale+ device features used in a user application is not known to the component supplier. Therefore, it remains a challenge for Xilinx to predict the power requirements of a given Zynq UltraScale+ device when it leaves the factory. Accurate estimates are obtained when the board design takes shape. For this purpose, Xilinx offers and supports a suite of integrated device power analysis tools to help users quickly and accurately estimate their design power requirements. Zynq UltraScale+ devices are supported similarly to previous products. The uncertainty of design power requirements makes it difficult to apply canned thermal solutions to fit all users. Therefore, Xilinx devices do not come with preset thermal solutions. Your design's operating conditions dictate the appropriate solution.

Thermal Resistance Data

Table 11-1 shows the thermal resistance data for Zynq UltraScale+ devices (grouped in the packages offered). The data includes junction-to-ambient in still air, junction-to-case, and junction-to-board data based on standard JEDEC four-layer measurements.

IMPORTANT: The data in Table 11-1 is for device/package comparison purposes only. Attempts to recreate this data are only valid using the transient 2-phase measurement techniques outlined in JESD51-14. Do not use these values for thermal simulations. Use the [Package Thermal Models \[Ref 22\]](#).

TIP: The thermal data query for all available devices by package is available on the Xilinx website: www.xilinx.com/cgi-bin/thermal/thermal.pl.

IMPORTANT: All packages are available with eutectic BGA balls. To order these packages, the device type starts with an XQ vs. XC or XA, and the Pb-free signifier in the package name is Q (for example: FFQE1156). Refer to the Pb-free version of these packages for their thermal resistance data and thermal models.

Table 11-1: Thermal Resistance Data

Notes:

1. This data is for device/package comparison purposes only. Attempts to recreate this data are only valid using the transient 2-phase measurement techniques outlined in JESD51-14. Do not use these values for thermal simulations. Use the [Package Thermal Models \[Ref 22\]](#).
2. All $\theta_{JA-Effective}$ values assume no heat sink and include thermal dissipation through a standard JEDEC four-layer board. The Xilinx power estimation tools (Vivado® Power Analysis, and Xilinx Power Estimator), which require detailed board dimensions and layer counts, are useful for deriving more precise $\theta_{JA-Effective}$ values.

Support for Thermal Models

Table 11-1 provides the traditional thermal resistance data for Zynq UltraScale+ devices. These resistances are measured using a prescribed JEDEC standard that might not necessarily reflect your actual board conditions and environment. The quoted θ_{JA} and θ_{JC} numbers are environmentally dependent, and JEDEC has traditionally recommended that these be used with that awareness. For more accurate junction temperature prediction, these might not be enough, and a system-level thermal simulation might be required.

Though Xilinx continues to support these figures of merit data, for Zynq UltraScale+ devices, boundary conditions independent thermal resistor network (Delphi) models are offered for all Zynq UltraScale+ devices. These compact models seek to capture the thermal behavior of the packages more accurately at predetermined critical points (junction, case, top, leads, and so on) with the reduced set of nodes as illustrated in Figure 11-1.

Unlike a full 3D model, these are computationally efficient and work well in an integrated system simulation environment. Delphi models are available for download on the Xilinx website (under the [Device Model tab](#)).

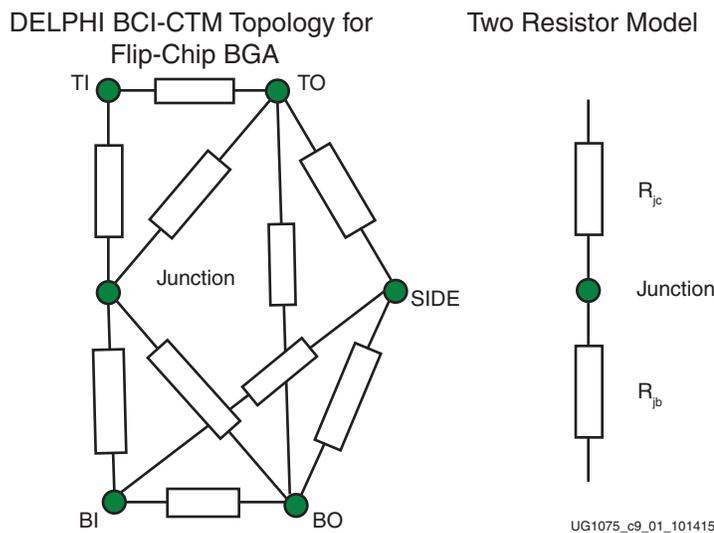

Figure 11-1: Thermal Model Topologies

RECOMMENDED: Xilinx recommends the use of the Delphi thermal model. Xilinx also recommends a best practice review of manufacturing variations on the thermal performance of the device from both the thermal interface material parameters and thermal solution variations. Examples of manufacture variations include the tolerance in airflow from a fan, the tolerance on performance of the heat pipe and vapor chamber, and manufacturing variations of the attachment of fins to the heat-sink base and the flatness of the surface.

Thermal Management Strategy

Introduction

As described in this section, Xilinx relies on a multi-pronged approach to consuming less power and dissipating heat for systems using Zynq® UltraScale+™ devices.

Flip-Chip Packages

Zynq UltraScale+ devices are offered in flip-chip BGA packages, which present a low thermal path. With the exception of the bare-die packages, the flip-chip BGA packages incorporate a heat spreader with an additional thermal interface material (TIM), as shown in Figure 12-1.

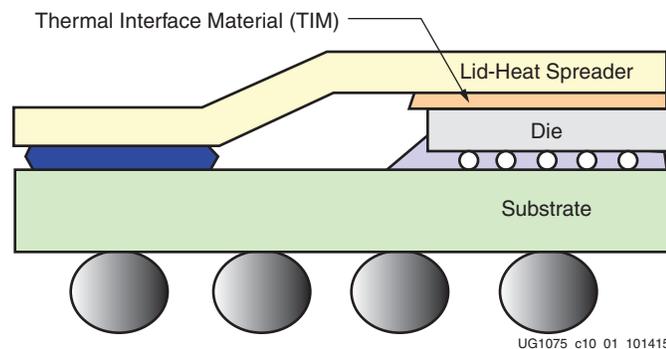

Figure 12-1: Heat Spreader with Thermal Interface Material

Materials with better thermal conductivity and consistent process deliver low thermal resistance to the heat spreader.

A parallel effort to ensure optimized package electrical return paths produces the added benefit of enhanced power and ground plane arrangement in the packages. A boost in copper density on the planes improves the overall thermal conductivity through the laminate. In addition, the extra dense and distributed via fields in the package increase the vertical thermal conductivity.

System Level Heat Sink Solutions

To complete a comprehensive thermal management strategy, an overall thermal budget that includes custom or OEM heat sink solutions depends on the physical and mechanical constraints of the system. A heat-sink solution, managed by the system-level designer, should be tailored to the design and specific system constraints. This includes understanding the inherent device capabilities for delivering heat to the surface.

By considering the system's physical, mechanical, and environmental constraints, the overall thermal budget is maintained and does not exceed the device's maximum operating temperature. The heat sink is an integral part of the thermal management solution to maintain a safe operating temperature. As a result, the system-level designer must be aware of the following:

- For lidless packages, the nominal stiffener height can be different from the height of the die. Therefore, the heat sink must have an island to contact the die.
- Especially for lidless packages, Xilinx advises against direct use of the θ_{JC} parameters (see [Table 11-1](#)) to determine the thermal performance of the device in your application. The calculation of these parameters are done in accordance with the JEDEC standard JESD51 where system parameters differ greatly from most applications. Instead, run thermal simulations of the system in worst-case environmental conditions using Delphi thermal models, which more accurately represent the device thermal performance under all boundary conditions.
- Consider the mechanical specifications of the package as well as the selection of the thermal interface between the die and the thermal management solution to ensure the lowest thermal contact resistance.
- The total thermal contact of the thermal interface material is determined based on parameters from the thermal interface supplier's data sheet.
- See the applied pressure recommendation on [page 269](#). Lower pressure runs the risk of poor thermal contact and higher pressure runs the risk of damaging the device; therefore, strict control of pressure is required.
- Consider all uncertainties in thermal modeling, including manufacturing variations from the thermal solutions (for example, fan airflow tolerance, heat pipe or vapor chamber performance tolerance, variation of the attachment of fins to heat sink base, and surface flatness).

Thermal Interface Material

When installing heat sinks for Zynq UltraScale+ devices, a suitable thermal interface material (TIM) must be used. This thermal material significantly aids the transfer of heat from the component to the heat sink.

For bare-die flip-chip BGAs, the surface of the silicon contacts the heat sink. For lidded flip-chip BGAs, the lid contacts the heat sink. The surface size of the bare-die flip-chip BGA and lidded flip-chip BGAs are different. Xilinx recommends a different type of thermal material for long-term use with each type of flip-chip BGAs package.

Thermal interface material is needed because even the largest heat sink and fan cannot effectively cool an Zynq UltraScale+ device unless there is good physical contact between the base of the heat sink and the top of the Zynq UltraScale+ device. The surfaces of both the heat sink and the Zynq UltraScale+ device silicon are not absolutely smooth. This surface roughness is observed when examined at a microscopic level. Because surface roughness reduces the effective contact area, attaching a heat sink without a thermal interface material is not sufficient due to inadequate surface contact.

A thermal interface material such as phase-change material, thermal grease, or thermal pads fills these gaps and allows effective transference of heat between the Zynq UltraScale+ device die and the heat sink.

The selection of the thermal interface (TIM) between the package and the thermal management solution is critical to ensure the lowest thermal contact resistance. Therefore, the following parameters must be considered.

1. The flatness of the lid and the flatness of the contact surface of the thermal solution.
2. The applied pressure of the thermal solution on the package, which must be within the allowable maximum pressure that can be applied on the package.
3. The total thermal contact of the thermal interface material. This value is determined based on the parameters in [step 1](#) and [step 2](#), which are published in the data sheet of the thermal interface supplier.

Types of TIM

There are many type of TIM available for sale. The most commonly used thermal interface materials are listed.

- Thermal grease
- Thermal pads
- Phase change material
- Thermal paste
- Thermal adhesives
- Thermal tape

Guidelines for Thermal Interface Materials

Five factors affect the choice, use, and performance of the interface material used between the processor and the heat sink:

- [Thermal Conductivity of the Material](#)
- [Electrical Conductivity of the Material](#)
- [Spreading Characteristics of the Material](#)
- [Long-Term Stability and Reliability of the Material](#)
- [Ease of Application](#)
- [Applied Pressure from Heat Sink to the Package via Thermal Interface Materials](#)

Thermal Conductivity of the Material

Thermal conductivity is the quantified ability of any material to transfer heat. The thermal conductivity of the interface material has a significant impact on its thermal performance. The higher the thermal conductivity, the more efficient the material is at transferring heat. Materials that have a lower thermal conductivity are less efficient at transferring heat, causing a higher temperature differential to exist across the interface. To overcome this less efficient heat transfer, a better cooling solution (typically, a more costly solution) must be used to achieve the desired heat dissipation.

Electrical Conductivity of the Material

Some metal-based TIM compounds are electrically conductive. Ceramic-based compounds are typically not electrically conductive. Manufacturers produce metal-based compounds with low-electrical conductivity, but some of these materials are not completely electrically inert. Metal-based thermal compounds are not hazardous to the Zynq UltraScale+ device die itself, but other elements on the Zynq UltraScale+ device or motherboard can be at risk if they become contaminated by the compound. For this reason, Xilinx does not recommend the use of electrically conductive thermal interface material.

Spreading Characteristics of the Material

The spreading characteristics of the thermal interface material determines its ability, under the pressure of the mounted heat sink, to spread and fill in or eliminate the air gaps between the Zynq UltraScale+ device and the heat sink. Because air is a very poor thermal conductor, the more completely the interface material fills the gaps, the greater the heat transference.

Long-Term Stability and Reliability of the Material

The long-term stability and reliability of the thermal interface material is described as the ability to provide a sufficient thermal conductance even after an extended time or extensive. Low-quality compounds can harden or leak out over time (the pump-out effect), leading to overheating or premature failure of the Zynq UltraScale+ device. High-quality compounds provide a stable and reliable thermal interface material throughout the lifetime of the device. Thermal greases with higher viscosities are typically more resistant to pump out effects on bare-die devices.

Ease of Application

A spreadable thermal grease requires the surface mount supplier to carefully use the appropriate amount of material. Too much or too little material can cause problems. The thermal pad is a fixed size and is therefore easier to apply in a consistent manner.

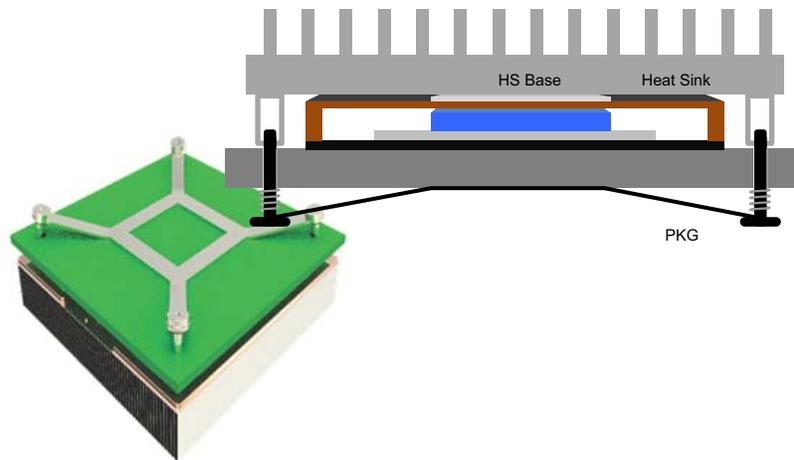

Applied Pressure from Heat Sink to the Package via Thermal Interface Materials

RECOMMENDED: *For the 0.8 mm and 1.0 mm packages, Xilinx recommends that the applied pressure on the package be in the range of 20 to 50 PSI for optimum performance of the thermal interface material (TIM) between the package and the heat sink. For the InFO packages (e.g., UBVA530), Xilinx recommends that the applied pressure on the package be in the range of 5 PSI. Thermocouples should not be present between the package and the heat sink, as their presence will degrade the thermal contact and result in incorrect thermal measurements. The best practice is to select the appropriate pressure (in the 20 to 50 PSI range) for the optimum thermal contact performance between the package and the thermal system solution, and the mechanical integrity of the package (with the thermal solution to pass all mechanical stress and vibration qualification tests).*

RECOMMENDED: Xilinx recommends using dynamic mounting around the four corners of the device package. On the PCB, use a bracket clip as part of the heat sink attachment to provide mechanical package support. See [Figure 12-2](#).

X15431-111316

Figure 12-2: Dynamic Mounting and Bracket Clips on Heat Sink Attachment

Heat Sink Removal

When removing or reworking heat sinks, the phase-change material residue must be removed from the surface of the die. Laird Technologies, Inc. provides the following guidance for complete removal of the phase-change material from the component.

Instructions for Removal of Phase-change Material

1. [Separate the Components](#)
2. [Scrape Away Thick Residue](#)
3. [Clean Remaining Residue with Solvent](#)
4. [Working with Laird Material](#)

Separate the Components

At room temperature, if possible, use a back and forth twisting motion to break the bond between the phase-change thermal interface material and mated components (i.e., heat sink and Zynq UltraScale+ device). See [Figure 12-3](#).

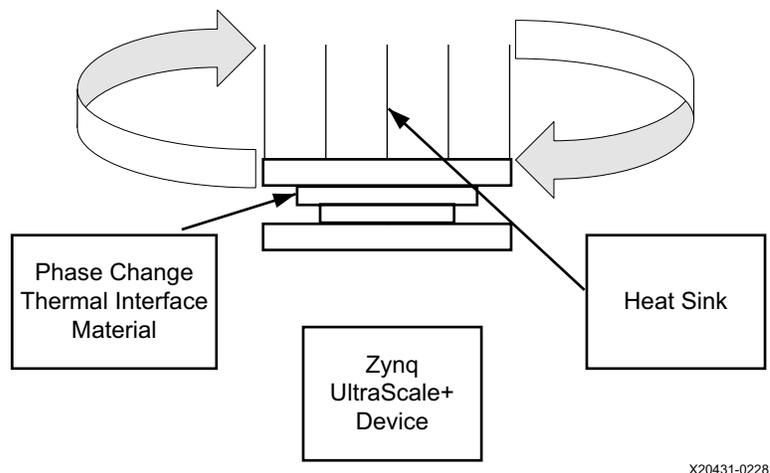

Figure 12-3: **Breaking the Bond between Thermal Interface Material and Mated Components**

For smaller components (typically 15 mm x 15 mm or less), the bond usually breaks free easily at room temperature. For larger components, in situations where minimal movement is available, or if using fragile components, heat the component (preferred) or heat sink to about 40°C–60°C before removal.

The guideline is 40°C–60°C, however, you might find that for your application, heating to 35°C is adequate. You might prefer to heat to 70°C which makes the phase-change thermal interface material very soft and the components can be easily separated.

Scrape Away Thick Residue

For a faster clean-up once components are separated, scrape away any large residual material amounts with a plastic spatula or a wooden tongue depressor. A clean dry rag can be used to wipe away excess material.

Clean Remaining Residue with Solvent

Using a clean cloth/wipe, wet it with your choice of solvent (see the following list) and wipe away any remaining residue.

- Toluene (easiest)
- Acetone (very good)
- Isoparaffinic hydrocarbon: Isopar, Soltrol (trade names) (very good)
- Isopropyl alcohol (OK)

Working with Laird Material

Safe handling, disposal, and first-aid measures for working with phase-change material are included in the Laird Technologies material safety data sheet (MSDS). Read the MSDS before using or handling. See the Laird Technologies, Inc. website, www.lairdtech.com.

Measurement Debug

When performing in-system thermal testing, to ensure accurate data and not incur damage to the device, do not place a thermocouple in between the device and the heat sink. On the extreme side, it might cause additional mechanical and/or thermal stress to the device, leading to damage. Even if damage does not occur, it often leads to a thicker and or uneven thermal interface material thickness, leading to a thermal performance difference from a system without a thermocouple. To obtain the device temperature, use the System Monitor as a non-invasive means to get accurate device measurements while debugging the system.

Heat Sink Guidelines for Bare-die Flip-Chip Packages

Heat Sink Attachments for Bare-die FB Packages

Heat sinks can be attached to the package in multiple ways. For heat to dissipate effectively, the advantages and disadvantages of each heat sink attachment method must be considered. Factors influencing the selection of the heat sink attachment method include the package type, contact area of the heat source, and the heat sink type.

Silicon and Decoupling Capacitors Height Consideration

When designing heat sink attachments for bare-die flip-chip BGA packages, the height of the die above the substrate and also the height of decoupling capacitors must be considered (Figure 13-1). This is to prevent electrical shorting between the heat sink (metal) and the decoupling capacitors.

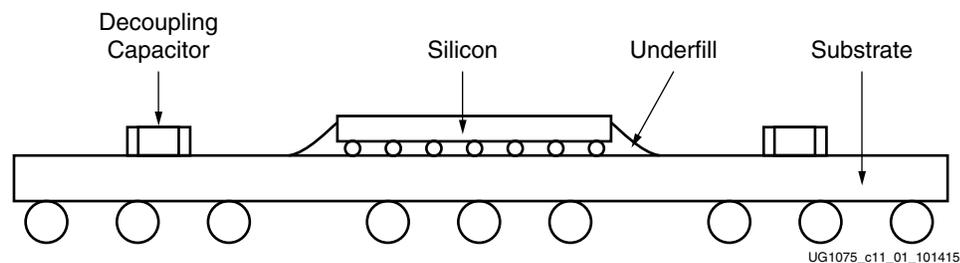

Figure 13-1: Cross Section of Bare-die Flip-chip BGA

Types of Heat Sink Attachments

There are six main methods for heat sink attachment. [Table 13-1](#) lists their advantages and disadvantages.

- [Thermal tape](#)
- [Thermally conductive adhesive or glue](#)
- [Wire form Z-clips](#)
- [Plastic clip-ons](#)
- [Threaded stand-offs \(PEMs\) and compression springs](#)
- [Push-pins and compression springs](#)

Table 13-1: Heat Sink Attachment Methods

Attachment Method	Advantages	Disadvantages
Thermal tape	<ul style="list-style-type: none"> • Generally easy to attach and is inexpensive. • Lowest cost approach for aluminum heat sink attachment. • No additional space required on the PCB. 	<ul style="list-style-type: none"> • The surfaces of the heat sink and the chip must be very clean to allow the tape to bond correctly. • Because of the small contact area, the tape might not provide sufficient bond strength. • Tape is a moderate to low thermal conductor that could affect the thermal performance.
Thermally conductive adhesive or glue	<ul style="list-style-type: none"> • Outstanding mechanical adhesion. • Fairly inexpensive, costs a little more than tape. • No additional space required on the PCB. 	<ul style="list-style-type: none"> • Adhesive application process is challenging and it is difficult to control the amount of adhesive to use. • Difficult to rework. • Because of the small contact area, the adhesive might not provide sufficient bond strength.
Wire form Z-clips	<ul style="list-style-type: none"> • It provides a strong and secure mechanical attachment. In environments that require shock and vibration testing, this type of strong mechanical attachment is necessary. • Easy to apply and remove. Does not cause the semiconductors to be destroyed (epoxy and occasionally tape can destroy the device). • It applies a preload onto the thermal interface material (TIM). Pre-loads actually improve thermal performance. 	<ul style="list-style-type: none"> • Requires additional space on the PCB for anchor locations.

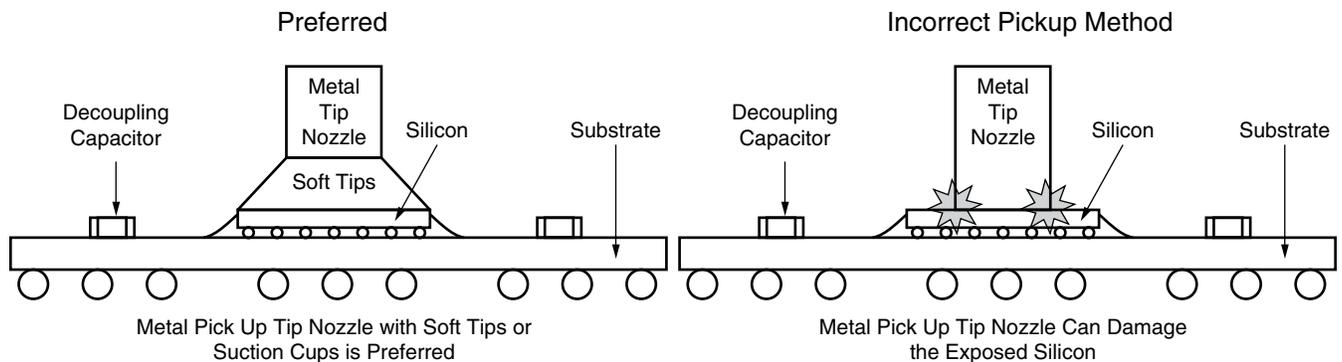

Table 13-1: Heat Sink Attachment Methods (Cont'd)

Attachment Method	Advantages	Disadvantages
Plastic clip-ons	<ul style="list-style-type: none"> • Suitable for designs where space on the PCB is limited. • Easy to rework by allowing heat sinks to be easily removed and reapplied without damaging the PCB board. • Can provide a strong enough mechanical attachment to pass shock and vibration test. 	<ul style="list-style-type: none"> • Needs a keep out area around the silicon devices to use the clip. • Caution is required when installing or removing clip-ons because localized stress can damage the solder balls or chip substrate.
Threaded stand-offs (PEMs) and compression springs	<ul style="list-style-type: none"> • Provides stable attachments to heat source and transfers load to the PCB, backing plate, or chassis. • Suitable for high mass heat sinks. • Allows for tight control over mounting force and load placed on chip and solder balls. 	<ul style="list-style-type: none"> • Holes are required in the PCB taking valuable space that can be used for trace lines. • Tends to be expensive, especially since holes need to be drilled or predrilled onto the PCB board to use stand-offs.
Push-pins and compression springs	<ul style="list-style-type: none"> • Provides a stable attachment to a heat source and transfers load to the PCB. • Allows for tight control over mounting force and load placed on chip and solder balls. 	<ul style="list-style-type: none"> • Requires additional space on the PCB for push-pin locations.

Heat Sink Attachment

Component Pick-up Tool Consideration

For pick-and-place machines to place bare-die flip-chip BGAs onto PCBs, Xilinx recommends using soft tips or suction cups for the nozzles. This prevents chipping, scratching, or even cracking of the bare die (Figure 13-2).

UG1075_c11_02_101415

Figure 13-2: Recommended Method For Using Pick-up Tools

Heat Sink Attachment Process Considerations

After the component is placed onto the PCBs, when attaching a heat sink to the bare-die package, the factors in Table 13-2 must be carefully considered (see Figure 13-3).

Table 13-2: Heat Sink Attachment Considerations

Consideration(s)	Effect(s)	Recommendation(s)
In heat sink attach process, what factors can cause damage to the exposed die and passive capacitors?	<ul style="list-style-type: none"> • Uneven heat sink placement • Uneven TIM thickness • Uneven force applied when placing heat sink placement 	<ul style="list-style-type: none"> • Even heat sink placement • Even TIM thickness • Even force applied when placing heat sink placement
Does the heat sink tilt or tip the post attachment?	Uneven heat sink placement will damage the silicon and can cause field failures.	<ul style="list-style-type: none"> • Careful handling not to contact the heat sink with the post attachment. • Use a fixture to hold the heat sink in place with post attachment until it is glued to the silicon.

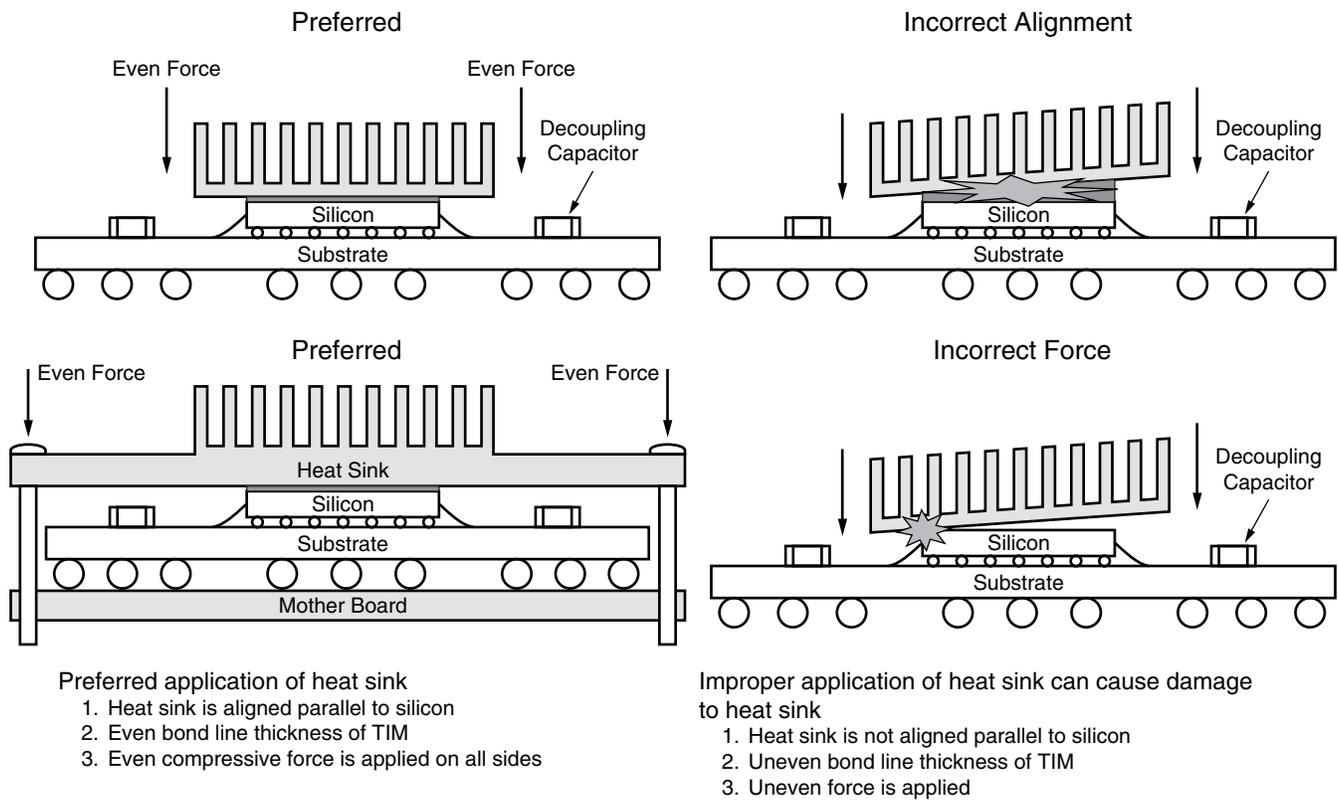

Figure 13-3: Recommended Application of Heat Sink

Standard Heat Sink Attach Process with Thermal Conductive Adhesive

Prior to attaching the heat sink, the Zynq UltraScale+ device needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.
2. Thermoset material (electrically non-conductive) is applied over the backside surface of silicon in a pattern using automated dispensing equipment. Automated dispensers are often used to provide a stable process speed at a relatively low cost. The optimum dispensing pattern needs to be determined by the SMT supplier.

Note: Minimal volume coverage of the backside of the silicon can result in non-optimum heat transfer.

3. The heat sink is placed on the backside of the silicon with a pick and place machine. A uniform pressure is applied over the heat sink to the backside of the silicon. As the heat sink is placed, the adhesive spreads to cover the backside silicon. A force transducer is normally used to measure and limit the placement force.
4. The epoxy is cured with heat at a defined time.

Note: The epoxy curing temperature and time is based on manufacturer's specifications.

Standard Heat Sink Attach Process with Thermal Adhesive Tape

Prior to attaching the heat sink, the Zynq UltraScale+ device needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.
2. Thermal adhesive tape cut to the size of the heat sink is applied on the underside of the heat sink at a modest angle with the use of a squeegee rubber roller. Apply pressure to help reduce the possibility of air entrapment under the tape during application.
3. The heat sink is placed on the backside of the silicon with a pick and place machine. A uniform pressure is applied over the heat sink to the backside of the silicon. As the heat sink is placed, the thermal adhesive tape is glued to the backside of the silicon. A force transducer is normally used to measure and limit the placement force.
4. A uniform and constant pressure is applied uniformly over the heat sink and held for a defined time.

Note: The thermal adhesive tape hold time is based on manufacturer's specifications.

Push-Pin and Shoulder Screw Heat Sink Attachment Process with Phase Change Material (PCM) Application

Prior to attaching the heat sink, the Zynq UltraScale+ device needs be surface mounted on the motherboard.

1. Place the motherboard into a jig or a fixture to hold the motherboard steady to prevent any movement during the heat sink attachment process.

Note: The jig or fixture needs to account for the push pin depth of the heat sink.

2. PCM tape, cut to the size of the heat sink, is applied on the underside of the heat sink at a modest angle with the use of a squeegee rubber roller. Apply pressure to help reduce the possibility of air entrapment under the tape during application.
3. Using the push-pin tool, heat sinks are applied over the packages ensuring a pin locking action with the PCB holes. The compression load from springs applies the appropriate mounting pressure required for proper thermal interface material performance.

Note: Heat sinks must not tilt during installation. This process cannot be automated due to the mechanical locking action which requires manual handling. The PCB drill hole tolerances need to be close enough to eliminate any issues concerning the heat sink attachment.

Additional Resources and Legal Notices

Xilinx Resources

For support resources such as Answers, Documentation, Downloads, and Forums, see [Xilinx Support](#).

Solution Centers

See the [Xilinx Solution Centers](#) for support on devices, software tools, and intellectual property at all stages of the design cycle. Topics include design assistance, advisories, and troubleshooting tips.

Documentation Navigator and Design Hubs

Xilinx® Documentation Navigator provides access to Xilinx documents, videos, and support resources, which you can filter and search to find information. To open the Xilinx Documentation Navigator (DocNav):

- From the Vivado® IDE, select **Help > Documentation and Tutorials**.
- On Windows, select **Start > All Programs > Xilinx Design Tools > DocNav**.
- At the Linux command prompt, enter `docnav`.

Xilinx Design Hubs provide links to documentation organized by design tasks and other topics, which you can use to learn key concepts and address frequently asked questions. To access the Design Hubs:

- In the Xilinx Documentation Navigator, click the **Design Hubs View** tab.
- On the Xilinx website, see the [Design Hubs](#) page.

Note: For more information on Documentation Navigator, see the [Documentation Navigator](#) page on the Xilinx website.

The information disclosed to you hereunder (the "Materials") is provided solely for the selection and use of Xilinx products. To the maximum extent permitted by applicable law: (1) Materials are made available "AS IS" and with all faults, Xilinx hereby DISCLAIMS ALL WARRANTIES AND CONDITIONS, EXPRESS, IMPLIED, OR STATUTORY, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, OR FITNESS FOR ANY PARTICULAR PURPOSE; and (2) Xilinx shall not be liable (whether in contract or tort, including negligence, or under any other theory of liability) for any loss or damage of any kind or nature related to, arising under, or in connection with, the Materials (including your use of the Materials), including for any direct, indirect, special, incidental, or consequential loss or damage (including loss of data, profits, goodwill, or any type of loss or damage suffered as a result of any action brought by a third party) even if such damage or loss was reasonably foreseeable or Xilinx had been advised of the possibility of the same. Xilinx assumes no obligation to correct any errors contained in the Materials or to notify you of updates to the Materials or to product specifications. You may not reproduce, modify, distribute, or publicly display the Materials without prior written consent. Certain products are subject to the terms and conditions of Xilinx's limited warranty, please refer to Xilinx's Terms of Sale which can be viewed at www.xilinx.com/legal.htm#tos; IP cores may be subject to warranty and support terms contained in a license issued to you by Xilinx. Xilinx products are not designed or intended to be fail-safe or for use in any application requiring fail-safe performance; you assume sole risk and liability for use of Xilinx products in such critical applications, please refer to Xilinx's Terms of Sale which can be viewed at www.xilinx.com/legal.htm#tos.

AUTOMOTIVE APPLICATIONS DISCLAIMER

AUTOMOTIVE PRODUCTS (IDENTIFIED AS "XA" IN THE PART NUMBER) ARE NOT WARRANTED FOR USE IN THE DEPLOYMENT OF AIRBAGS OR FOR USE IN APPLICATIONS THAT AFFECT CONTROL OF A VEHICLE ("SAFETY APPLICATION") UNLESS THERE IS A SAFETY CONCEPT OR REDUNDANCY FEATURE CONSISTENT WITH THE ISO 26262 AUTOMOTIVE SAFETY STANDARD ("SAFETY DESIGN"). CUSTOMER SHALL, PRIOR TO USING OR DISTRIBUTING ANY SYSTEMS THAT INCORPORATE PRODUCTS, THOROUGHLY TEST SUCH SYSTEMS FOR SAFETY PURPOSES. USE OF PRODUCTS IN A SAFETY APPLICATION WITHOUT A SAFETY DESIGN IS FULLY AT THE RISK OF CUSTOMER, SUBJECT ONLY TO APPLICABLE LAWS AND REGULATIONS GOVERNING LIMITATIONS ON PRODUCT LIABILITY.
