Overview

Product Specification

Designing with the Core

Introduction

The Advanced eXtensible Interface (AXI) Central Direct Memory Access (CDMA) core is a soft Xilinx Intellectual Property (IP) core for use with the Xilinx Embedded Development Kit (EDK). The AXI CDMA provides high-bandwidth Direct Memory Access (DMA) between a memory-mapped source address and a memory-mapped destination address using the AXI4 protocol. An optional Scatter Gather (SG) feature can be used to off-load control and sequencing tasks from the System Central Processing Unit (CPU). Initialization, status, and control registers are accessed through an AXI4-Lite slave interface, suitable for the Xilinx MicroBlaze™ microprocessor.

Features

- AXI4 Memory Map interface for data transfer
- Independent AXI4-Lite Slave interface for register access
- Independent AXI4 Master interface for optional Scatter/Gather function.
- Optional Data Realignment Engine
- Register Direct Mode.
Optional Scatter Gather DMA support
- Optional Store and Forward support
- Parameterized Read and Write Address Pipeline depths
- Fixed-address and Incrementing-address burst support

LogiCORE IP Facts Table	
Core Specifics	
Supported Device Family ⁽¹⁾	Zynq™-7000 ⁽²⁾ , Virtex®-7, Kintex™-7, Artix™-7, Virtex-6, Spartan®-6
Supported User Interfaces	AXI4, AXI4-Lite
Resources	See Table 2-3 , Table 2-4 , and Table 2-5 .
Provided with Core	
Design Files	ISE®: VHDL Vivado™: RTL
Example Design	Not Provided
Test Bench	Not Provided
Constraints File	Not Provided
Simulation Model	Not Provided
Supported S/W Driver ⁽³⁾	Standalone and Linux
Tested Design Flows⁽⁴⁾	
Design Entry	ISE Design Suite, Embedded Edition v14.4 Vivado Design Suite ⁽⁵⁾ v2012.4
Simulation	Mentor Graphics ModelSim ISim, Vivado simulator
Synthesis	Xilinx Synthesis Technology (XST) Vivado Synthesis
Support	
Provided by Xilinx @ www.xilinx.com/support	

Notes:

1. For a complete list of supported derivative devices, see the [Embedded Edition Derivative Device Support](#).
2. Supported in ISE Design Suite implementations only.
3. Standalone driver details can be found in the EDK or SDK directory (<install_directory>/doc/usenglish/xilinx_drivers.htm). Linux OS and driver support information is available from [//wiki.xilinx.com](http://wiki.xilinx.com).
4. For the supported versions of the tools, see the [Xilinx Design Tools: Release Notes Guide](#).
5. Supports only 7 series devices.

Overview

The AXI CDMA is designed to provide a centralized DMA function for use in an embedded processing system employing the AXI4 system interfaces. The core supports both a simple CDMA operation mode and an optional Scatter Gather mode.

Figure 1-1 shows the functional composition of the AXI CDMA. It contains the following major functional blocks:

- Registers
- Scatter Gather
- Cntl/Sts Logic
- DataMover

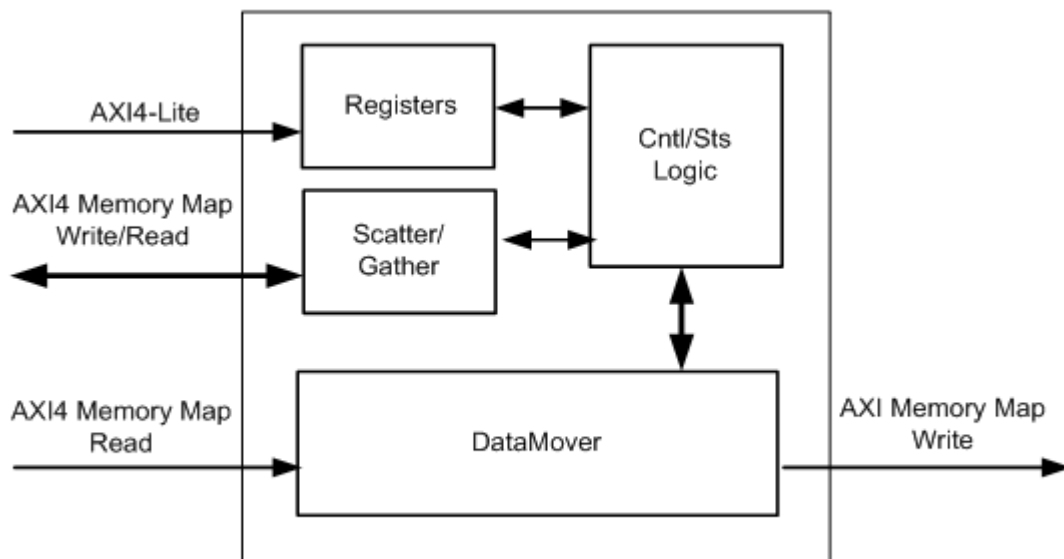

Figure 1-1: AXI CDMA Block Diagram

Registers

This block contains control and status registers that allows you to configure AXI CDMA through the AXI4-Lite slave interface. See [Register Space in Chapter 2](#).

Scatter Gather

The AXI CDMA can also optionally include Scatter/Gather (SG) functionality for off-loading CPU management tasks to hardware automation. The Scatter/Gather Engine fetches and updates CDMA control transfer descriptors from system memory through dedicated the AXI4 Scatter Gather Master interface. The SG engine provides internal descriptor queuing which allows descriptor prefetch and processing in parallel with ongoing CDMA data transfer operations.

Cntl/Sts Logic

This block manages overall CDMA operation. It coordinates DataMover command loading and status retrieval and updates it back to Registers block.

DataMover

The DataMover is used for high-throughput transfer of data. The DataMover provides CDMA operations with 4 KB address boundary protection, automatic burst partitioning, and can queue multiple transfer requests. Furthermore, the DataMover provides byte-level data realignment (for 32-bit and 64-bit data widths) allowing the CDMA to read from and write to any byte offset combination.

Feature Summary

- Independent AXI4-Lite Slave interface for register access
 - Fixed 32-bit data width
 - Optional asynchronous operation mode
- Independent AXI4 Master interface for primary CDMA datapath. Parameterizable width of 32, 64, 128, 256, 512, and 1024 bits with fixed-address burst (key hole) support.
- Independent AXI4 Master interface for optional Scatter/Gather function. Fixed 32-bit data width.
- Optional Data Realignment Engine for the primary CDMA datapath. Available with 32 and 64-bit datapath widths.
- Provides Simple DMA only mode and an optional hybrid mode supporting both Simple DMA and Scatter Gather automation.
- Optional Store and Forward operation mode.
- Parameterized Read and Write Address Pipeline depths.

Applications

The AXI CDMA provides a high performance CDMA function for Embedded Systems.

Licensing and Ordering Information

This Xilinx LogiCORE™ IP module is provided at no additional cost with the Xilinx Vivado™ Design Suite and ISE® Design Suite Embedded Edition tools under the terms of the [Xilinx End User License](#).

Information about this and other Xilinx LogiCORE IP modules is available at the [Xilinx Intellectual Property](#) page. For information on pricing and availability of other Xilinx LogiCORE IP modules and tools, contact your [local Xilinx sales representative](#).

Product Specification

Performance

This section details the performance information for various core configurations.

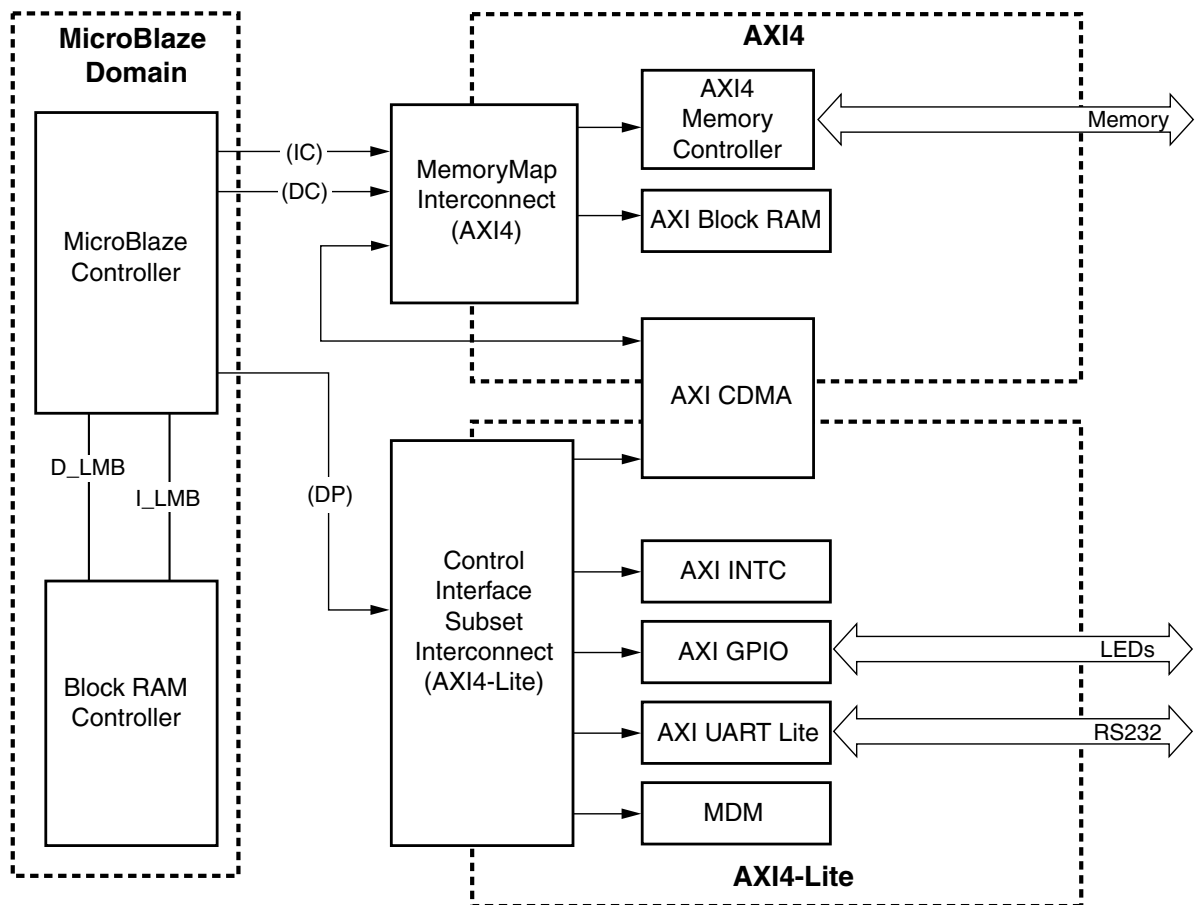

Figure 2-1: Virtex-6 and Spartan-6 FPGA System Configuration Diagram

Maximum Frequencies

The maximum frequencies are calculated based on a benchmarking design which is filled with dummy logic to get 70% Look-up Table (LUT) utilization. The resulting target F_{Max} are shown in [Table 2-1](#).

Table 2-1: Maximum Frequencies

Family	Device	Speed Grade	F_{Max} (MHz)	
			AXI4	AXI4-Lite
Spartan-6	XC6SLX45T	-2	150	100
Virtex-6	XC6VLX240T	-1	200	150
Virtex-7	XC7VX485TFFG1761	-1	200	150
Kintex-7	XC7K325TFFG900	-1	200	150
Zynq-7000	XC7Z030FBG676	-1	200	150

Throughput

Due to the parameterizable nature of the AXI CDMA, throughput is best measured as a percentage of the AXI4 bus bandwidth available to the AXI CDMA ([Table 2-2](#)). This available bus bandwidth is a function of the clock frequency of the AXI4 bus and the parameterized data width of the AXI CDMA. The other parameter affecting throughput is the value assigned to the `C_M_AXI_BURST_LEN` parameter of the AXI CDMA. In general, the bigger value assigned increases the realized throughput of the AXI CDMA. However, larger burst lengths can be detrimental to other components of a user system design (causing lower system performance) so this is a trade-off that you must evaluate.

Table 2-2: AXI CDMA Throughput

<code>C_M_AXI_BURST_LEN</code>	Test Packet Size	AXI4 Frequency (<code>m_axi_aclk</code> input in Virtex-6 FPGA)	Observed Bus Bandwidth Utilization by AXI CDMA
16	9000 bytes	150 MHz	70%
64	9000 bytes	150 MHz	up to 99%

Standards

The AXI CDMA core is AXI4 and AXI4-Lite compliant.

Resource Utilization

Resource utilization numbers for the AXI CDMA core are shown for the 7 series and Zynq™-7000 devices in [Table 2-3](#), for the Virtex®-6 FPGA family in [Table 2-4](#), and for the Spartan®-6 FPGA family in [Table 2-5](#).

Port Descriptions

The AXI CDMA signals are described in [Table 2-6](#).

Table 2-6: AXI CDMA I/O Signal Description

Signal Name	Interface	Signal Type	Init Status	Description
System Signals				
m_axi_aclk	Clock	I	–	AXI CDMA Synchronization Clock
cdma_introut	Interrupt	O	0	Interrupt output for the AXI CDMA core
AXI4-Lite Slave Interface Signals				
s_axi_lite_aclk	S_AXI_LITE	I	–	Synchronization Clock for the AXI4-Lite interface. This clock can be the same as m_axi_aclk (synchronous mode) or different (asynchronous mode). Note: If it is asynchronous, the frequency of this clock must be less than or equal to the frequency of the m_axi_aclk.
s_axi_lite_aresetn	S_AXI_LITE	I	–	Active-Low AXI4-Lite Reset. When asserted Low, the AXI4-Lite Register interface and the entire CDMA core logic is put into hard reset. This signal must be synchronous to s_axi_lite_aclk.
s_axi_lite_awvalid	S_AXI_LITE	I	–	AXI4-Lite Write Address Channel Write Address Valid 0 = Write address is not valid 1 = Write address is valid
s_axi_lite_awready	S_AXI_LITE	O	0	AXI4-Lite Write Address Channel Write Address Ready. Indicates CDMA ready to accept the write address. 0 = Not ready to accept address 1 = Ready to accept address
s_axi_lite_awaddr(5:0)	S_AXI_LITE	I	–	AXI4-Lite Write Address Bus
s_axi_lite_wvalid	S_AXI_LITE	I	–	AXI4-Lite Write Data Channel Write Data Valid. 0 = Write data is not valid 1 = Write data is valid
s_axi_lite_wready	S_AXI_LITE	O	0	AXI4-Lite Write Data Channel Write Data Ready. Indicates CDMA ready to accept the write data. 0 = Not ready to accept data 1 = Ready to accept data
s_axi_lite_wdata(31:0)	S_AXI_LITE	I	–	AXI4-Lite Write Data Bus

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
s_axi_lite_bresp(1:0)	S_AXI_LITE	O	0	AXI4-Lite Write Response Channel. Indicates results of the write transfer. The AXI CDMA Lite interface always responds with OKAY. 00 = OKAY – Normal access has been successful 01 = EXOKAY – Not supported 10 = SLVERR – Not supported 11 = DECERR – Not supported
s_axi_lite_bvalid	S_AXI_LITE	O	0	AXI4-Lite Write Response Channel Response Valid. Indicates response is valid. 0 = Response is not valid 1 = Response is valid
s_axi_lite_bready	S_AXI_LITE	I	–	AXI4-Lite Write Response Channel Ready. Indicates target is ready to receive response. 0 = Not ready to receive response 1 = Ready to receive response
s_axi_lite_arvalid	S_AXI_LITE	I	–	AXI4-Lite Read Address Channel Read Address Valid 0 = Read address is not valid 1 = Read address is valid
s_axi_lite_arready	S_AXI_LITE	O	0	AXI4-Lite Read Address Channel Read Address Ready. Indicates CDMA ready to accept the read address. 0 = Not ready to accept address 1 = Ready to accept address
s_axi_lite_araddr(5:0)	S_AXI_LITE	I	–	AXI4-Lite Read Address Bus
s_axi_lite_rvalid	S_AXI_LITE	O	0	AXI4-Lite Read Data Channel Read Data Valid 0 = Read data is not valid 1 = Read data is valid
s_axi_lite_rready	S_AXI_LITE	I	–	AXI4-Lite Read Data Channel Read Data Ready. Indicates target ready to accept the read data. 0 = Not ready to accept data 1 = Ready to accept data
s_axi_lite_rdata(31:0)	S_AXI_LITE	O	0	AXI4-Lite Read Data Bus
s_axi_lite_rresp(1:0)	S_AXI_LITE	O	0	AXI4-Lite Read Response Channel Response. Indicates results of the read transfer. The AXI CDMA Lite interface always responds with OKAY. 00 = OKAY – Normal access has been successful 01 = EXOKAY – Not supported 10 = SLVERR – Not supported 11 = DECERR – Not supported

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
CDMA Data AXI4 Read Master Interface Signals				
m_axi_araddr (C_M_AXI_ADDR_WIDTH-1: 0)	M_AXI	O	0	Read Address Channel Address Bus.
m_axi_arlen(7:0)	M_AXI	O	0	Read Address Channel Burst Length. In data beats - 1.
m_axi_arsize(2:0)	M_AXI	O	0	Read Address Channel Burst Size. Indicates width of burst transfer. 000 = Not Supported by AXI CDMA 001 = Not Supported by AXI CDMA 010 = 4 bytes (32-bit wide burst) 011 = 8 bytes (64-bit wide burst) 100 = 16 bytes (128-bit wide burst) 101 = 32 bytes (256-bit wide burst) 110 = Not Supported by AXI CDMA 111 = Not Supported by AXI CDMA
m_axi_arburst(1:0)	M_AXI	O	0	Read Address Channel Burst Type. Indicates type burst. 00 = FIXED – Key Hole Operation 01 = INCR – Incrementing address 10 = WRAP – Not supported 11 = Reserved
m_axi_arprot(2:0)	M_AXI	O	000	Read Address Channel Protection. Always driven with a constant output of 000.
m_axi_arcache(3:0)	M_AXI	O	0011	Read Address Channel Cache. This is always driven with a constant output of 0011.
m_axi_arvalid	M_AXI	O	0	Read Address Channel Read Address Valid. Indicates when the Read Address Channel qualifiers are valid. 0 = Read address is not valid 1 = Read address is valid
m_axi_arready	M_AXI	I	–	Read Address Channel Read Address Ready. Indicates target is ready to accept the read address. 0 = Target not ready to accept address 1 = Target read to accept address
m_axi_rdata (C_M_AXI_DATA_WIDTH-1: 0)	M_AXI	I	–	Read Data Channel Read Data
m_axi_rresp(1:0)	M_AXI	I	–	Read Data Channel Response. Indicates results of the read transfer. 00 = OKAY – Normal access has been successful 01 = EXOKAY – Not supported 10 = SLVERR – Slave returned error on transfer 11 = DECERR – Decode error, transfer targeted unmapped address

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
m_axi_rlast	M_AXI	I	–	Read Data Channel Last. Indicates the last data beat of a burst transfer. 0 = Not last data beat 1 = Last data beat
m_axi_rvalid	M_AXI	I	–	Read Data Channel Data Valid. Indicates m_axi_rdata is valid. 0 = Not valid read data 1 = Valid read data
m_axi_rready	M_AXI	O	0	Read Data Channel Ready. Indicates the read channel is ready to accept read data. 0 = Not ready 1 = Ready
CDMA Data AXI4 Write Master Interface Signals				
m_axi_awaddr (C_M_AXI_ADDR_WIDTH-1: 0)	M_AXI	O	0	Write Address Channel Address Bus
m_axi_awlen(7: 0)	M_AXI	O	0	Write Address Channel Burst Length. In data beats - 1.
m_axi_awsz(2: 0)	M_AXI	O	0	Write Address Channel Burst Size. Indicates width of burst transfer. 000 = Not Supported by AXI CDMA 001 = Not Supported by AXI CDMA 010 = 4 bytes (32-bit wide burst) 011 = 8 bytes (64-bit wide burst) 100 = 16 bytes (128-bit wide burst) 101 = 32 bytes (256-bit wide burst) 110 = Not Supported by AXI CDMA 111 = Not Supported by AXI CDMA
m_axi_awburst(1:0)	M_AXI	O	0	Write Address Channel Burst Type. Indicates type burst. 00 = Fixed address (key hole). 01 = INCR – Incrementing address 10 = WRAP – Not supported 11 = Reserved
m_axi_awprot(2:0)	M_AXI	O	000	Write Address Channel Protection. This is always driven with a constant output of 000.
m_axi_awcache(3:0)	M_AXI	O	0011	Write Address Channel Cache. This is always driven with a constant output of 0011.
m_axi_awvalid	M_AXI	O	0	Write Address Channel Write Address Valid. Indicates when the Write Address Channel qualifiers are valid. 0 = Write Address is not valid 1 = Write Address is valid

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
m_axi_awready	M_AXI	I	–	Write Address Channel Write Address Ready. Indicates target is ready to accept the write address. 0 = Target not ready to accept address 1 = Target read to accept address
m_axi_wdata (C_M_AXI_DATA_WIDTH-1: 0)	M_AXI	O	0	Write Data Channel Write Data Bus
m_axi_wstrb (C_M_AXI_DATA_WIDTH/8 - 1: 0)	M_AXI	O	0	Write Data Channel Write Strobe Bus. Indicates which bytes are valid in the write data bus. This value is passed from the stream side strobe bus.
m_axi_wlast	M_AXI	O	0	Write Data Channel Last. Indicates the last data beat of a burst transfer. 0 = Not last data beat 1 = Last data beat
m_axi_wvalid	M_AXI	O	0	Write Data Channel Data Valid. Indicates m_axi_wdata is valid. 0 = Not valid write data 1 = Valid write data
m_axi_wready	M_AXI	I	–	Write Data Channel Ready. Indicates the write channel target is ready to accept write data. 0 = Target is not ready 1 = Target is ready
m_axi_bresp(1:0)	M_AXI	I	–	Write Response Channel Response. Indicates results of the write transfer. 00 = OKAY – Normal access has been successful 01 = EXOKAY – Not supported 10 = SLVERR – Slave returned error on transfer 11 = DECERR – Decode error, transfer targeted unmapped address
m_axi_bvalid	M_AXI	I	–	Write Response Channel Response Valid. Indicates response, m_axi_bresp, is valid. 0 = Response is not valid 1 = Response is valid
m_axi_bready	M_AXI	O	0	Write Response Channel Ready. Indicates the write channel is ready to receive the AXI write response. 0 = Not ready to receive response 1 = Ready to receive response
Scatter Gather AXI4 Read Master Interface Signals				
m_axi_sg_araddr (C_M_AXI_SG_ADDR_WIDTH-1: 0)	M_AXI_SG	O	0	Scatter Gather Read Address Channel Address Bus
m_axi_sg_arlen(7: 0)	M_AXI_SG	O	0	Scatter Gather Read Address Channel Burst Length. Length in data beats - 1.

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
m_axi_sg_arsize(2: 0)	M_AXI_SG	O	0	Scatter Gather Read Address Channel Burst Size. Indicates width of burst transfer. 010 = 4 bytes (32-bit wide burst). Other values are not supported.
m_axi_sg_arburst(1:0)	M_AXI_SG	O	0	Scatter Gather Read Address Channel Burst Type. Indicates type burst. 01 = INCR – Incrementing address. Other values are not supported.
m_axi_sg_arprot(2:0)	M_AXI_SG	O	000	Scatter Gather Read Address Channel Protection. This is always driven with a constant output of 000.
m_axi_sg_arcache(3:0)	M_AXI_SG	O	0011	Scatter Gather Read Address Channel Cache. This is always driven with a constant output of 0011.
m_axi_sg_arvalid	M_AXI_SG	O	0	Scatter Gather Read Address Channel Read Address Valid. Indicates if m_axi_sg_araddr is valid. 0 = Read Address is not valid 1 = Read Address is valid
m_axi_sg_arready	M_AXI_SG	I	–	Scatter Gather Read Address Channel Read Address Ready. Indicates target is ready to accept the read address. 0 = Target not ready to accept address 1 = Target read to accept address
m_axi_sg_rdata (C_M_AXI_SG_DATA_WIDTH-1: 0)	M_AXI_SG	I	–	Scatter Gather Read Data Channel Read Data
m_axi_sg_rresp(1:0)	M_AXI_SG	I	–	Scatter Gather Read Data Channel Response. Indicates results of the read transfer. 00 = OKAY – Normal access has been successful 01 = EXOKAY – Not supported 10 = SLVERR – Slave returned error on transfer 11 = DECERR – Decode error, transfer targeted unmapped address
m_axi_sg_rlast	M_AXI_SG	I	–	Scatter Gather Read Data Channel Last. Indicates the last data beat of a burst transfer. 0 = Not last data beat 1 = Last data beat
m_axi_sg_rdata	M_AXI_SG	I	–	Scatter Gather Read Data Channel Data Valid. Indicates m_sg_aximry_rdata is valid. 0 = Not valid read data 1 = Valid read data
m_axi_sg_rready	M_AXI_SG	O	0	Scatter Gather Read Data Channel Ready. Indicates the read channel is ready to accept read data. 0 = Not ready 1 = Ready

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
Scatter Gather AXI4 Write Master Interface Signals				
m_axi_sg_awaddr (C_M_AXI_SG_ADDR_WIDTH-1: 0)	M_AXI_SG	O	0	Scatter Gather Write Address Channel Address Bus
m_axi_sg_awlen(7: 0)	M_AXI_SG	O	0	Scatter Gather Write Address Channel Burst Length. Length in data beats - 1.
m_axi_sg_awsz(2: 0)	M_AXI_SG	O	0	Scatter Gather Write Address Channel Burst Size. Indicates with of burst transfer. 010 = 4 bytes (32-bit wide burst). Other values are not supported.
m_axi_sg_awburst(1:0)	M_AXI_SG	O	0	Scatter Gather Write Address Channel Burst Type. Indicates type burst. 01 = INCR – Incrementing address. Other values are not supported.
m_axi_sg_awprot(2:0)	M_AXI_SG	O	000	Scatter Gather Write Address Channel Protection. This is always driven with a constant output of 000.
m_axi_sg_awcache(3:0)	M_AXI_SG	O	0011	Scatter Gather Write Address Channel Cache. This is always driven with a constant output of 0011.
m_axi_sg_awvalid	M_AXI_SG	O	0	Scatter Gather Write Address Channel Write Address Valid. Indicates if m_axi_sg_awaddr is valid. 0 = Write Address is not valid 1 = Write Address is valid
m_axi_sg_awready	M_AXI_SG	I	–	Scatter Gather Write Address Channel Write Address Ready. Indicates target is ready to accept the write address. 0 = Target not ready to accept address 1 = Target ready to accept address
m_axi_sg_wdata (C_M_AXI_SG_DATA_WIDTH-1: 0)	M_AXI_SG	O	0	Scatter Gather Write Data Channel Write Data Bus
m_axi_sg_wstrb (C_M_AXI_SG_DATA_WIDTH/8 - 1: 0)	M_AXI_SG	O	1111	Scatter Gather Write Data Channel Write Strobe Bus. All strobe bytes asserted for SG write address channel transfer requests.
m_axi_sg_wlast	M_AXI_SG	O	0	Scatter Gather Write Data Channel Last. Indicates the last data beat of a burst transfer. 0 = Not last data beat 1 = Last data beat
m_axi_sg_wvalid	M_AXI_SG	O	0	Scatter Gather Write Data Channel Data Valid. Indicates the Write Data Channel has a valid data beat on the bus. 0 = Not valid write data 1 = Valid write data

Table 2-6: AXI CDMA I/O Signal Description (Cont'd)

Signal Name	Interface	Signal Type	Init Status	Description
m_axi_sg_wready	M_AXI_SG	I	–	Scatter Gather Write Data Channel Ready. Indicates the SG Write Data Channel target slave is ready to accept write data. 0 = Target slave is not ready 1 = Target slave is ready
m_axi_sg_bresp(1:0)	M_AXI_SG	I	–	Scatter Gather Write Response Channel Response. Indicates results of the write transfer. 00 = OKAY – Normal access has been successful 01 = EXOKAY – Not supported 10 = SLVERR – Slave returned error on transfer 11 = DECERR – Decode error, transfer targeted unmapped address
m_axi_sg_bvalid	M_AXI_SG	I	–	Scatter Gather Write Response Channel Response Valid. Indicates response, m_axi_sg_bresp, is valid. 0 = Response is not valid 1 = Response is valid
m_axi_sg_bready	M_AXI_SG	O	0	Scatter Gather Write Response Channel Ready. Indicates source is ready to receive response. 0 = Not ready to receive response 1 = Ready to receive response

Register Space

The AXI CDMA core register space is summarized in Table 2-7. The AXI CDMA Registers are memory-mapped into non-cacheable memory space.

IMPORTANT: The registers are 32 bits wide and the register memory space must be aligned on 128-byte (80h) boundaries.

Endianess

All registers are in Little Endian format, as shown in Figure 2-2.

Figure 2-2: 32-bit Little Endian Example

Register Address Mapping

Table 2-7: AXI CDMA Register Summary

Address Space Offset ^a	Name	Description
00h	CDMACR	CDMA Control
04h	CDMASR	CDMA Status
08h	CURDESC_PNTR	Current Descriptor Pointer
0Ch	Reserved	N/A
10h	TAILDESC_PNTR	Tail Descriptor Pointer
14h	Reserved	N/A
18h	SA	Source Address
1Ch	Reserved	N/A
20h	DA	Destination Address
24h	Reserved	N/A
28h	BTT	Bytes to Transfer

a. Address Space Offset is relative to C_BASEADDR assignment. C_BASEADDR is defined in AXI CDMA MPD file and set by XPS.

Register Details

CDMACR (CDMA Control – Offset 00h)

This register provides software application control of the AXI CDMA.

Figure 2-3: CDMACR Register

Table 2-8: CDMACR Register Details

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
31 to 24	IRQDelay	00h	R/W	SG	<p>Interrupt Delay Time Out. This value is used for setting the interrupt delay time out value. The interrupt time out is a mechanism for causing the CDMA engine to generate an interrupt after the delay time period has expired. Timer begins counting at the end of a packet and resets with receipt of a new packet or a time out event occurs.</p> <p>Note: Setting this value to zero disables the delay timer interrupt.</p> <p>Note: This field is ignored when AXI CDMA is configured for simple CDMA mode (C_INCLUDE_SG = 0)</p>
23 to 16	IRQThreshold	01h	R/W	SG	<p>Interrupt Threshold. This value is used for setting the interrupt threshold. When IOC interrupt events occur, an internal counter counts down from the Interrupt Threshold setting. When the count reaches zero, an interrupt out is generated by the DMA engine.</p> <p>Note: The minimum setting for the threshold is 0x01. A write of 0x00 to this register has no effect.</p> <p>Note: This field is ignored when AXI DMA is configured for Simple DMA Mode (C_INCLUDE_SG = 0)</p>
15	Reserved	0	RO	N/A	Writing to this bit has no effect and it is always read as zeroes.
14	Err_IrqEn	0	R/W	Simple and SG	<p>Error Interrupt Enable. When set to 1, it allows the CDMASR.Err_Irq to generate an interrupt out.</p> <p>0 = Error Interrupt disabled 1 = Error Interrupt enabled</p>

Table 2-8: CDMACR Register Details (Cont'd)

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
13	Dly_IrqEn	0	R/W	SG	Delay Timer Interrupt Enable. When set to 1, it allows CDMASR.Dly_Irq to generate an interrupt out. This is only used with Scatter Gather assisted transfers. 0 = Delay Interrupt disabled 1 = Delay Interrupt enabled
12	IOC_IrqEn	0	R/W	Simple and SG	Complete Interrupt Enable. When set to 1, it allows CDMASR.IOC_Irq to generate an interrupt out for completed DMA transfers. 0 = IOC Interrupt disabled 1 = IOC Interrupt enabled
11 to 6	Reserved	0	RO	N/A	Writing to these bits has no effect and they are always read as zeroes.
5	Key Hole Write	0	R/W	Simple and SG	Writing 1 to this enables the keyhole write (FIXED address AXI transaction). This value should not be changed when a transfer is in progress. This value should remain constant until all the descriptors are processed (for SG = 1). CDMA shows unexpected behavior if this value is changed in the middle of a transfer. It is the responsibility of the slave device to enforce the functionality. When enabling Key Hole operation, the MAX BURST LENGTH should be set to 16.
4	Key Hole Read	0	R/W	Simple and SG	Writing 1 to this enables the keyhole read (FIXED address AXI transaction). This value should not be changed when a transfer is in progress. This value should remain constant until all the descriptors are processed (for SG = 1). CDMA shows unexpected behavior if this value is changed in the middle of a transfer. It is the responsibility of the slave device to enforce the functionality. When enabling Key Hole operation, the MAX BURST LENGTH should be set to 16.
3	SGMode	0	R/W	Simple and SG	This bit controls the transfer mode of the CDMA. Setting this bit to a 1 causes the AXI CDMA to operate in a Scatter Gather mode if the Scatter Gather engine is included (C_INCLUDE_SG = 1). 0 = Simple DMA Mode 1 = Scatter Gather Mode (Only valid if C_INCLUDE_SG = 1) This bit must only be changed when the CDMA engine is idle (CDMASR.IDLE = 1). Changing the state of this bit at any other time has undefined results. This bit must be set to a 0 then back to 1 by the software application to force the CDMA SG engine to use a new value written to the CURDESC_PNTR register. This bit must be set prior to setting the CDMACR.Dly_IrqEn bit. Otherwise, the CDMACR.Dly_IrqEn bit does not get set.

Table 2-8: CDMACR Register Details (Cont'd)

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
2	Reset	0	R/W	Simple and SG	Soft reset control for the AXI CDMA core. Setting this bit to a 1 causes the AXI CDMA to be reset. Reset is accomplished gracefully. Committed AXI4 transfers are then completed. Other queued transfers are flushed. After completion of a soft reset, all registers and bits are in the Reset State. 0 = Reset NOT in progress – Normal operation 1 = Reset in progress
1	TailPntrEn	1	RO	SG	Indicates tail pointer mode is enabled to the SG Engine. This bit is fixed to 1 and always read as 1 when SG is included. If the CDMA is built with SG disabled (Simple Mode Only), the default value of the port is 0.
0	Reserved	0	RO	N/A	Writing to these bits has no effect, and they are always read as zeroes.

RO = Read Only. Writing has no effect.
R/W = Read/Write.

CDMASR (CDMA Status – Offset 04h)

This register provides status for the AXI CDMA.

Figure 2-4: CDMASR Register

Table 2-9: CDMASR Register Details

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
31 to 24	IRQDelaySts	00h	RO	SG	Interrupt Delay Time Status. This field reflects the current interrupt delay timer value in the SG Engine.
23 to 16	IRQThresholdSts	01h	RO	SG	Interrupt Threshold Status. This field reflects the current interrupt threshold value in the SG Engine.
15	Reserved	0	RO	N/A	Always read as zero.
14	Err_Irq	0	R/WC	Simple and SG	Interrupt on Error. When set to 1, this bit indicates an interrupt event has been generated due to an error condition. If the corresponding enable bit is set (CDMACR.Err_IrqEn = 1), an interrupt out is generated from the AXI CDMA. 0 = No error Interrupt 1 = Error interrupt active
13	Dly_Irq	0	R/WC	SG	Interrupt on Delay. When set to 1, this bit indicates an interrupt event has been generated on a delay timer time out. If the corresponding enable bit is set (CDMACR.Dly_IrqEn = 1), an interrupt out is generated from the AXI CDMA. 0 = No Delay Interrupt 1 = Delay Interrupt active This bit is cleared whenever CDMACR.SGMode is set to 0.
12	IOC_Irq	0	R/WC	Simple and SG	Interrupt on Complete. When set to 1, this bit indicates an interrupt event has been generated on completion of a DMA transfer (either a Simple or SG). If the corresponding enable bit is set (CDMACR.IOC_IrqEn = 1), an interrupt out is generated from the AXI CDMA. 0 = No IOC Interrupt 1 = IOC Interrupt active When operating in SG mode, the criteria specified by the interrupt threshold must also be met.
11	Reserved	0	RO	N/A	Writing to this bit has no effect and it is always read as zeroes.

Table 2-9: CDMASR Register Details (Cont'd)

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
10	SGDecErr	0	RO	SG	<p>Scatter Gather Decode Error. This bit indicates that a AXI decode error has been received by the SG Engine during a AXI transfer (transfer descriptor read or write). This error occurs if the SG Engine issues an address request to an invalid location. This error condition causes the AXI CDMA to gracefully halt. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shut down. CURDESC_PNTR register is updated with the descriptor pointer value when this error is detected.</p> <p>0 = No SG Decode Errors 1 = SG Decode Error detected. CDMA Engine halts.</p> <p>A reset (soft or hard) must be issued to clear the error condition.</p>
9	SGSlvErr	0	RO	SG	<p>Scatter Gather Slave Error. This bit indicates that a AXI slave error response has been received by the SG Engine during a AXI transfer (transfer descriptor read or write). This error condition causes the AXI CDMA to gracefully halt. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shut down. CURDESC_PNTR register is updated with the descriptor pointer value when this error is detected.</p> <p>0 = No SG Slave Errors 1 = SG Slave Error detected. CDMA Engine halts.</p> <p>A reset (soft or hard) must be issued to clear the error condition.</p>
8	SGIntErr	0	RO	SG	<p>Scatter Gather Internal Error. This bit indicates that a internal error has been encountered by the SG Engine. This error condition causes the AXI CDMA to gracefully halt. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shutdown. CURDESC_PNTR register is updated with the descriptor pointer value when this error is detected.</p> <p>0 = No SG Internal Errors 1 = SG Internal Error detected. CDMA Engine halts.</p> <p>A reset (soft or hard) must be issued to clear the error condition.</p>
7	Reserved	0	RO	N/A	Writing to this bit has no effect and it is always read as zeroes.

Table 2-9: CDMASR Register Details (Cont'd)

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
6	DMADecErr	0	RO	Simple and SG	<p>DMA Decode Error. This bit indicates that an AXI decode error has been received by the AXI DataMover. This error occurs if the DataMover issues an address request to an invalid location. This error condition causes the AXI CDMA to halt gracefully. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shut down. CURDESC_PNTR register is updated with the descriptor pointer value when this error is detected.</p> <p>0 = No CDMA Decode Errors. 1 = CDMA Decode Error detected. CDMA Engine halts.</p> <p>A reset (soft or hard) must be issued to clear the error condition.</p>
5	DMASlvErr	0	RO	Simple and SG	<p>DMA Slave Error. This bit indicates that a AXI slave error response has been received by the AXI DataMover during a AXI transfer (read or write). This error condition causes the AXI CDMA to gracefully halt. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shut down. CURDESC_PNTR register is updated with the descriptor pointer value when this error is detected.</p> <p>0 = No CDMA Slave Errors. 1 = CDMA Slave Error detected. CDMA Engine halts.</p> <p>A reset (soft or hard) must be issued to clear the error condition.</p>

Table 2-9: CDMASR Register Details (Cont'd)

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
4	DMAIntErr	0	RO	Simple and SG	<p>DMA Internal Error. This bit indicates that an internal error has been encountered by the DataMover on the data transport channel. This error can occur if a 0 value BTT (bytes to transfer) is fed to the AXI DataMover or DataMover has an internal processing error. A BTT of 0 only happens if the BTT register is written with zeroes (in Simple DMA mode) or a BTT specified in the Control word of a fetched descriptor is set to 0 (SG Mode). This error condition causes the AXI CDMA to gracefully halt. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shut down. CURDESC_PNTR register is updated with the descriptor pointer value when this error is detected.</p> <p>0 = No CDMA Internal Errors. 1 = CDMA Internal Error detected. CDMA Engine halts.</p> <p>A reset (soft or hard) must be issued to clear the error condition.</p>
3	SGIncl	See Description	RO	Simple and SG	<p>SG Included. This bit indicates if the AXI CDMA has been implemented with Scatter Gather support included (C_SG_ENABLE = 1). This is used by application software (drivers) to determine if SG Mode can be utilized.</p> <p>0 = Scatter Gather not included. Only Simple DMA operations are supported. 1 = Scatter Gather is included. Both Simple DMA and Scatter Gather operations are supported.</p>
2	Reserved	0	RO	N/A	Writing to these bits has no effect and they are always read as zeroes.

Table 2-9: CDMASR Register Details (Cont'd)

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
1	Idle	0	RO	Simple and SG	<p>CDMA Idle. Indicates the state of AXI CDMA operations.</p> <p>When set and in Simple DMA mode, the bit indicates the programmed transfer has completed and the CDMA is waiting for a new transfer to be programmed. Writing to the BTT register in Simple DMA mode causes the CDMA to start (not Idle).</p> <p>When set and in SG mode, the bit indicates the SG Engine has reached the tail pointer for the associated channel and all queued descriptors have been processed. Writing to the tail pointer register automatically restarts CDMA SG operations.</p> <p>0 = Not Idle – Simple or SG DMA operations are in progress. 1 = Idle – Simple or SG operations completed or not started.</p>
0	Reserved	0	RO	SG	Writing to these bits has no effect and they are always read as zeroes.

RO = Read Only. Writing has no effect.
 R/WC = Read/Write to Clear. A CPU write of 1 clears the associated bit to 0.

CURDESC_PNTR (CDMA Current Descriptor Pointer – Offset 08h)

This register provides the Current Descriptor Pointer for the AXI CDMA Scatter Gather Descriptor Management.

Figure 2-5: CURDESC_PNTR Register

Table 2-10: CURDESC_PNTR Register Details

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
31 to 6	Current Descriptor Pointer	0	R/W (RO)	SG	<p>Current Descriptor Pointer. Indicates the pointer of current descriptor being worked on. This register must contain a pointer to a valid descriptor prior to writing the TAILDESC_PTR register. Failure to do so results in an undefined operation by the CDMA.</p> <p>When the CDMA SG Engine is running (CDMASR.IDLE = 0), the CURDESC_PNTR register is updated by the SG Engine to reflect the starting address of the current descriptor being executed.</p> <p>On error detection, the CURDESC_PNTR register is updated to reflect the descriptor associated with the detected error.</p> <p>The register should only be written by the software application when the AXI CDMA is idle (CDMASR.IDLE = 1). Descriptor addresses written to this field must be aligned to 64-byte boundaries (sixteen 32-bit words). Examples are 0x00, 0x40, 0x80. Any other alignment has undefined results.</p> <p>This register is cleared when CDMACR.SGMode = 0.</p>
5 to 0	Reserved	0	RO	N/A	Writing to these bits has no effect and they are always read as zeroes.

RO = Read Only. Writing has no effect.
R/WC = Read/Write to Clear. A write of 1 clears the associated bit to 0.

TAILDESC_PNTR (CDMA Tail Descriptor Pointer – Offset 10h)

This register provides Tail Descriptor Pointer for the AXI CDMA Scatter Gather Descriptor Management.

Figure 2-6: TAILDESC_PNTR Register

Table 2-11: TAILDESC_PNTR Register Details

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
31 to 6	Tail Descriptor Pointer	0	R/W (RO)	SG	<p>Tail Descriptor Pointer. Indicates pause pointer for descriptor chain execution. The AXI CDMA SG Engine pauses descriptor fetching after completing operations on the descriptor whose current descriptor pointer matches the tail descriptor pointer.</p> <p>When the AXI CDMA is in SG Mode (CDMACR.SGMode = 1), a write by the software application to the TAILDESC_PNTR register causes the AXI CDMA SG Engine to start fetching descriptors starting from the CURDESC_PNTR register value. If the SG engine is paused at a tailpointer pause point, the SG engine restarts descriptor execution at the next sequential transfer descriptor. If the AXI CDMA is not idle (CDMASR.IDLE = 0), writing to the TAILDESC_PNTR has no effect except to reposition the SG pause point.</p> <p>This register is cleared when CDMACR.SGMode = 0.</p>
5 to 0	Reserved	0	RO	N/A	Writing to these bits has no effect and they are always read as zeroes.

RO = Read Only. Writing has no effect.
R/WC = Read/Write to Clear - A CPU write of 1 clears the associated bit to 0.

SA (CDMA Source Address – Offset 18h)

This register provides the source address for Simple DMA transfers by AXI CDMA.

Figure 2-7: SA Register

Table 2-12: SA Register Details

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
31 to 0	SA	0	R/W	Simple	Source Address Register. This register is used by Simple DMA operations (CDMACR.SGMode = 0) as the starting read address for DMA data transfers. The address value written can be at any byte offset. The software application should only write to this register when the AXI CDMA is idle (CDMASR.IDLE = 1).

RO = Read Only. Writing has no effect.
R/W = Read/Write.

DA (CDMA Destination Address – Offset 20h)

This register provides the Destination Address for Simple DMA transfers by AXI CDMA.

Figure 2-8: DA Register

Table 2-13: DA Register Details

Bits	Field Name	Default Value	Access Type	CDMA Mode Used	Description
31to 0	DA	0	RO	Simple	Destination Address Register. This register is used by Simple DMA operations as the starting write address for DMA data transfers. The address value written has restrictions relative to the Source Address and Data Realignment Engine (DRE) inclusion as follows. If DRE is not included in the AXI CDMA (C_INCLUDE_DRE = 0) or the DMA data width is 128 or 256 bits (C_M_AXI_DATA_WIDTH = 128 or 256), then the address offset of the Destination address <i>must</i> match that of the Source Address Register value. Offset is defined as that portion of a system address that is used to designate a byte position within a single data beat width. For example, a 32-bit data bus has four addressable byte positions within a single data beat (0, 1, 2, and 3). The portion of the address that designates these positions is the offset. The number of address bits used for the offset varies with the transfer bus data width. The software application should only write to this register when the AXI CDMA is idle (CDMASR.IDLE = 1).

RO = Read Only. Writing has no effect.
R/WC = Read / Write to Clear. A CPU write of 1 clears the associated bit to 0.

BTT (CDMA Bytes to Transfer – Offset 28h)

This register provides the value for the bytes to transfer for Simple DMA transfers by the AXI CDMA.

Figure 2-9: BTT Register

Table 2-14: BTT Register Details

Bits	Field Name	Default Value	Access Type	Description
31 to 23	Reserved	0	RO	Writing to these bits has no effect, and they are always read as zeroes.
22 to 0	BTT	0	R/W (RO)	<p>Bytes to Transfer. This register field is used for Simple DMA transfers and indicates the desired number of bytes to DMA from the Source Address to the Destination Address. A maximum of 8,388,607 bytes of data can be specified by this field for the associated transfer. Writing to the BTT Register also initiates the Simple DMA transfer.</p> <p>Note: A value of zero (0) is not allowed and causes a DMA internal error to be set by AXI CDMA. The software application should only write to this register when the AXI CDMA is idle (CDMASR.IDLE = 1).</p>

RO = Read Only. Writing has no effect.
R/W = Read/Write.

Designing with the Core

General Design Guidelines

A typical MicroBlaze™ processor based system is shown in [Figure 3-1](#).

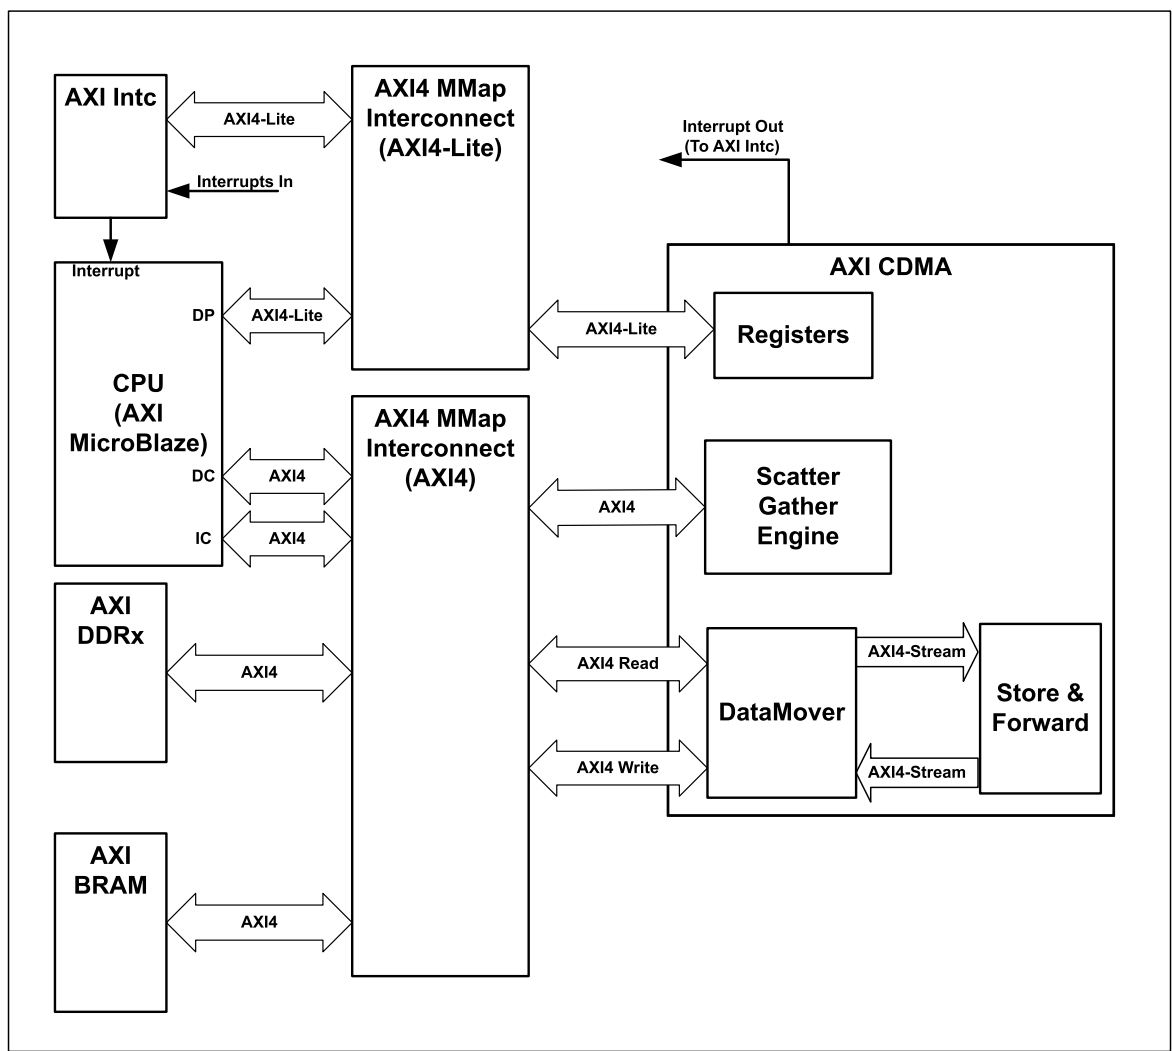

Figure 3-1: Typical MicroBlaze Processor System Configuration Using AXI CDMA

X12445

Clocking

AXI CDMA provides two clocking modes of operation: asynchronous and synchronous. In asynchronous mode, AXI4-Lite interface is asynchronous to AXI4-MMap interface. This is achieved by setting `C_AXI_LITE_IS_ASYNC = 1`. In this case, `s_axi_lite_aclk` can be less than or equal to `m_axi_aclk`. In synchronous mode, `C_AXI_LITE_IS_ASYNC = 0`, both `s_axi_lite_aclk` and `m_axi_aclk` run at same frequency.

Resets

An active-Low reset assertion on the `s_axi_lite_aresetn` input results in a reset of the entire AXI CDMA core logic. This is considered a hardware reset and there are no graceful completions of AXI4 transfers in progress. A hardware reset initializes all AXI CDMA registers to the default state, all internal queues are flushed, and all internal logic is returned to power on conditions. It is required that the `s_axi_lite_aresetn` input be synchronous to the `s_axi_lite_aclk` input.

Note: Reset should be asserted for minimum of 8 clock cycles to the core to take effect.

Design Parameters

The AXI CDMA design parameters are listed and described in [Table 3-1](#).

Table 3-1: AXI CDMA Design Parameter Description

Parameter Name	Allowable Values	Default Values	VHDL Type	Feature/Description
AXI CDMA General Parameters				
C_FAMILY	virtex6, spartan6, Virtex7, Kintex7, Artix7, Zynq	virtex6	String	Specifies the target FPGA family
AXI CDMA AXI4-Lite Parameters				
C_S_AXI_LITE_ADDR_WIDTH	6	6	integer	Address width (in bits) of AXI4-Lite Interface. This is currently fixed at 6 bits.
C_S_AXI_LITE_DATA_WIDTH	32	32	integer	Data width (in bits) of AXI4-Lite Interface. This is currently fixed at 32 bits.
C_AXI_LITE_IS_ASYNC	0,1	0	integer	Specifies if the s_axi_lite_aclk is different than the m_axi_aclk 0 = s_axi_lite_aclk is the same as m_axi_aclk 1 = s_axi_lite_aclk is different than the m_axi_aclk
AXI CDMA Data AXI4 Master Parameters				
C_M_AXI_ADDR_WIDTH	32	32	integer	Address width of the AXI4 master interface for the Data transfer path.
C_M_AXI_DATA_WIDTH	32, 64, 128, 256, 512, 1024	32	integer	Data width of the AXI4 master interface for the Data transfer path.
C_M_AXI_MAX_BURST_LEN	16, 32, 64, 128, 256	16	integer	Specifies the maximum burst length to be requested by the Data AXI4 master for both read and writes. Note: When enabling Key Hole read or write, the max burst length should be set to 16.
C_INCLUDE_DRE	0, 1	0	integer	Specifies the inclusion or omission of the Data Realignment Engine (DRE) in the DataMover (can only be included for 32-bit and 64-bit data widths). 0 = Exclude DRE 1 = Include DRE

Table 3-1: AXI CDMA Design Parameter Description (Cont'd)

Parameter Name	Allowable Values	Default Values	VHDL Type	Feature/Description
C_USE_DATAMOVER_LITE	0, 1	0	integer	Specifies the use of a reduced resource version of the DataMover (can only be used for 32-bit and 64-bit data widths, no DRE, and burst lengths limited to 16, 32, and 64). <i>This parameter is ignored if Scatter Gather is enabled (C_INCLUDE_SG = 1).</i> 0 = Normal DataMover (full version) 1 = Reduced resource DataMover
C_READ_ADDR_PIPE_DEPTH	1 to 30	4	integer	This parameter specifies the depth of the DataMover read address pipelining queues for the data transport channels.
C_WRITE_ADDR_PIPE_DEPTH	1 to 30	4	integer	This parameter specifies the depth of the DataMover write address pipelining queues for the data transport channels.
Store and Forward Parameters				
C_INCLUDE_SF	0, 1	1	integer	Specifies the inclusion or omission of the Store and Forward feature 0 = Exclude Store and Forward 1 = Include Store and Forward
Scatter Gather Related Parameters				
C_INCLUDE_SG	0, 1	0	integer	Specifies the inclusion or omission of the Scatter Gather feature 0 = Exclude Scatter Gather 1 = Include Scatter Gather
C_M_AXI_SG_ADDR_WIDTH	32	32	integer	Address width (in bits) of AXI Scatter Gather AXI4 Master interface
C_M_AXI_SG_DATA_WIDTH	32	32	integer	Data width (in bits) of AXI Scatter Gather AXI4 Master interface
C_DLYTMR_RESOLUTION	1 to 1000000	125	integer	Specifies the resolution of one tick of the SG interrupt delay timer in m_axi_aclk cycles

DataMover Lite Mode Restrictions

The AXI DataMover that is internally used by the AXI CDMA can be optionally programmed to a reduced feature set to provide a reduced resource utilization footprint in the target FPGA (see CDMA resource utilizations in [Table 2-4](#) and [Table 2-5](#)). Using the DataMover Lite operation mode puts restrictions on the available CDMA features. The following is a list of feature restrictions (compared to the Full mode).

- AXI CDMA data transport width is restricted to 32 and 64 bits.

`C_M_AXI_DATA_WIDTH` = 32 or 64 only

- Maximum Burst Length is restricted to 16, 32, and 64 data beats.

`C_M_AXI_MAX_BURST_LEN` = 16, 32, or 64 only

- Maximum allowed bytes to transfer (BTT) value that is programmed per transfer request is limited to the specified maximum burst length times the specified CDMA data width divided by 8.

$C_M_AXI_MAX_BURST_LEN \times (C_M_AXI_DATA_WIDTH/8)$

- The DRE function is not supported with Data Mover Lite.

`C_INCLUDE_DRE` must be set to 0

Note: In case the CDMA is configured in Lite Mode, the 4K address crossing guard must be done by the software application when specifying the Source Address, the Destination Address, and the BTT values programmed into the CDMA registers.

Programming Sequence

Simple DMA Mode

The basic mode of operation for the CDMA is Simple DMA. In this mode, the CDMA executes one programmed DMA command and then stops. This requires the CDMA registers to be set up by an external AXI4 Master for each DMA operation required.

These basic steps describe how to set up and initiate a CDMA transfer in simple operation mode.

1. Verify `CDMASR.IDLE` = 1.
2. Program the `CDMACR.IOC_IrqEn` bit to the desired state for interrupt generation on transfer completion. Also set the error interrupt enable (`CDMACR.ERR_IrqEn`), if so desired.

3. Write the desired transfer source address to the Source Address (SA) Register. The transfer data at the source address must be valid and ready for transfer.
4. Write the desired transfer destination address to the Destination Address (DA) Register.
5. Write the number of bytes to transfer to the CDMA Bytes to Transfer (BTT) Register. Up to 8,388,607 bytes can be specified for a single transfer (unless DataMover Lite is being used). Writing to the BTT register also starts the transfer.
6. Either poll the CDMASR.IDLE bit for assertion (CDMASR.IDLE = 1) or wait for the CDMA to generate an output interrupt (assumes CDMACR.IOC_IrqEn = 1).
7. If interrupt based, determine the interrupt source (transfer completed or an error has occurred).
8. Clear the CDMASR.IOC_Irq bit by writing a 1 to the DMASR.IOC_Irq bit position.
9. Ready for another transfer. Go back to step 1.

Scatter Gather Mode

Scatter Gather is a mechanism that allows for automated DMA transfer scheduling through a pre-programmed instruction list of transfer descriptors ([Scatter Gather Transfer Descriptor Definition](#)). This instruction list is programmed by the user software application into a memory-resident data structure that must be accessible by the AXI CDMA SG interface. This list of instructions is organized into what is referred to as a transfer descriptor chain. Each descriptor has an address pointer to the next sequential descriptor to be processed. The last descriptor in the chain generally points back to the first descriptor in the chain but it is not required.

CDMA operations begins with the setup of the descriptor pointer registers and the CDMA control registers. The following lists minimum steps, in order, required for AXI CDMA operations:

1. Write a valid pointer to channel CURDESC_PNTR register (Offset 0x08).
2. Write control information to channel CDMACR register (Offset 0x00) to set interrupt enables and key hole feature if desired.
3. Write a valid pointer to the channel TAILDESC_PNTR register (Offset 0x10). This starts the channel fetching and processing descriptors.
4. CDMA scatter gather operations continue until the descriptor at TAILDESC_PNTR is processed, and then the engine idles as indicated by CDMASR.Idle = 1.

Transfer Descriptor Management

Prior to starting CDMA Scatter Gather operations, the software application must set up a transfer descriptor chain. After the AXI CDMA begins SG operations, it fetches, processes, and then update the descriptors. By analyzing the descriptors, the software application can track the status of the associated CDMA data transfer and determine the completion status of the transfer. With this information, the software application can manage the transfer. The act of writing to the TAILDESC register causes the AXI CDMA hardware, if it is paused at the tail pointer, to begin processing descriptors again.

If the AXI CDMA hardware is not paused at the TAILDESC pointer, writing to the TAILDESC register makes AXI CDMA continue to process descriptors until it reaches the new tail descriptor pointer location.

Scatter Gather Transfer Descriptor Definition

This defines the format and contents of the AXI CDMA Scatter Gather Transfer Descriptors. These are used only by the SG function if it is enabled in the CDMA by assigning the parameter C_INCLUDE_SG a value of 1 and the CDMACR.SGMode bit is set to 1. A transfer descriptor consists of eight 32-bit words. The descriptor represents the control and status information needed for a single CDMA transfer plus address linkage to the next sequential descriptor. Each descriptor can define a single CDMA transfer of up to 8,388,607 Bytes of data. A descriptor chain is defined as a series of descriptors that are sequentially linked through the address linkage built into the descriptor format.

The AXI CDMA SG Engine traverses the descriptor chain following the linkage until the last descriptor of the chain has been completed. The relationship and identification of the AXI CDMA transfer descriptor words is shown in [Table 3-2](#).

Note: Transfer Descriptors must be aligned on 16 32-bit word alignment. Example valid offsets are 0x00, 0x40, 0x80, and 0xC0.

Table 3-2: Transfer Descriptor Word Summary

Address Space Offset ^a	Name	Description
00h	NXTDESC_PNTR	Next Descriptor Pointer
04h	RESERVED	N/A
08h	SA	Source Address
0Ch	RESERVED	N/A
10h	DA	Destination Address
14h	RESERVED	N/A
18h	CONTROL	Transfer Control
1Ch	STATUS	Transfer Status

a. Address Space Offset is relative to the address of the first word of the Transfer Descriptor in system memory.

Transfer Descriptor NXTDESC_PNTR (Next Descriptor Pointer – Offset 00h)

This word provides the address pointer to the first word of the next transfer descriptor in the descriptor chain.

Figure 3-2: Transfer Descriptor NXTDESC_PNTR Word

Table 3-3: Transfer Descriptor NXTDESC_PNTR Word Details

Bits	Field Name	Description
31 to 6	NxtDescPntr	Next Descriptor Pointer. This field is an address pointer (most significant 26 bits) to the first word of the next transfer descriptor to be executed by the CDMA SG Engine. The least-significant 6 bits of this register are appended to this value when used by the SG Engine forcing transfer descriptors to be loaded in memory at 128-byte address alignment.
5 to 0	Reserved	These bits are reserved and fixed to zeroes. This forces the address value programmed in this register to be aligned to 128-byte aligned addresses.

Transfer Descriptor SA Word (Source Address – Offset 08h)

This word provides the starting address for the data read operations for the associated DMA transfer.

Figure 3-3: Transfer Descriptor SA Word

Table 3-4: Transfer Descriptor SA Word Details

Bits	Field Name	Description
31 to 0	SA	Source Address. This value specifies the starting address for data read operations for the associated DMA transfer. The address value can be at any byte offset.

Transfer Descriptor DA Word (Destination Address – Offset 10h)

This word provides the starting address for the data write operations for the associated DMA transfer.

Figure 3-4: Transfer Descriptor DA Word

Table 3-5: Transfer Descriptor DA Word Details

Bits	Field Name	Description
31 to 0	DA	Destination Address. This value specifies the starting write address for DMA data transfers. The address value has restrictions relative to the Source Address and AXI CDMA DRE inclusion. If DRE is not included in the AXI CDMA (C_INCLUDE_DRE = 0) or the specified CDMA data width is not supported by DRE (C_M_AXI_DATA_WIDTH = 128 or more), then the address offset of the Destination Address <i>must</i> match that of the Source Address value.

Transfer Descriptor CONTROL Word (Control – Offset 18h)

This value provides control for the AXI CDMA transfer.

Figure 3-5: Transfer Descriptor CONTROL Word

Table 3-6: Transfer Descriptor CONTROL Word Details

Bits	Field Name	Description
31 to 23	Reserved	These bits are reserved and should be set to zero.
22 to 0	BTT	Bytes to Transfer. This field in the Control word specifies the desired number of bytes to DMA from the Source Address to the Destination Address. A maximum of 8,388,607 bytes of data can be specified by this field for the associated transfer. A value of zero (0) is not allowed and causes a DMA internal error to be set by AXI CDMA.

Transfer Descriptor Status Word (Status – Offset 1Ch)

This value provides status to the software application regarding the execution of the Transfer Descriptor by the AXI CDMA. This status word should be zeroed when the transfer descriptor is programmed by the software application. When the AXI CDMA SG Engine has completed execution of the transfer descriptor, the status word is updated and written back to the original status word location in memory by the SG Engine.

Figure 3-6: Transfer Descriptor Status Word

Table 3-7: Transfer Descriptor Status Word Details

Bits	Field Name	Description
31	Cmplt	Transfer Completed. This indicates to the software application that the CDMA Engine has completed the transfer as described by the associated descriptor. The software application can manipulate any descriptor with the Completed bit set to 1 when in Tail Pointer Mode (currently the only supported mode). 0 = Descriptor not completed 1 = Descriptor completed If the CDMA SG Engine fetches a descriptor is with this bit set to 1, the descriptor is considered a stale descriptor. An SGIntErr is flagged in the AXI CDMA Status Register and the AXI CDMA engine halts with no update to the descriptor.
30	DMADecErr	DMA Decode Error. This bit indicates that an AXI decode error was received by the AXI CDMA DataMover. This error occurs if the DataMover issues an address that does not have a mapping assignment to a slave device. This error condition causes the AXI CDMA to gracefully halt. 0 = No CDMA Decode Errors 1 = CDMA Decode Error received. CDMA Engine halts at this descriptor
29	DMASlvErr	DMA Slave Error. This bit indicates that a AXI slave error response was received by the AXI CDMA DataMover during the AXI transfer (read or write) associated with this descriptor. This error condition causes the AXI CDMA to gracefully halt. 0 = No CDMA Slave Errors 1 = CDMA Slave Error received. CDMA Engine halts at this descriptor

Table 3-7: Transfer Descriptor Status Word Details (Cont'd)

Bits	Field Name	Description
28	DMAIntErr	<p>DMA Internal Error. This bit indicates that an internal error was encountered by the AXI CDMA DataMover on the data transport channel during the execution of this descriptor. This error can occur if a 0 value BTT (bytes to transfer) is fed to the AXI DataMover or DataMover has an internal processing error. A BTT of 0 only happens if the BTT field in the transfer descriptor CONTROL word is programmed with a value of zero. This error condition causes the AXI CDMA to gracefully halt. The CDMASR.IDLE bit is set to 1 when the CDMA has completed shutdown.</p> <p>0 = No CDMA Internal Errors 1 = CDMA Internal Error detected. CDMA Engine halts at this descriptor</p>
27 to 0	Reserved	These bits are reserved and should be set to zero.

Interrupts

An interrupt output is provided by the AXI CDMA. This output drives high when an internal interrupt event is logged in the CDMA Status Register (CDMASR) and the associated interrupt enable bit is set in the CDMA Control Register (CDMACR).

IMPORTANT: This interrupt output is synchronized to the `s_axi_lite_aclk` clock input.

Internal interrupt events are different depending on whether the AXI CDMA is operating in Simple DMA mode or SG Mode. Simple DMA mode generates an IOC interrupt whenever a programmed transfer is completed. In addition, three error conditions reported by the DataMover (internal error, slave error, and decode error) can also generate an interrupt assertion. For Scatter Gather mode, the delay interrupt and the three SG engine error interrupt events are added to the interrupt event mix.

SG Interrupt Threshold and Interrupt Coalescing

The AXI CDMA interrupt coalescing feature is enabled by setting the CDMACR.IRQThreshold field to a value greater than the default value of 1. When a SG session is started in the CDMA, the CDMACR.IRQThreshold field is loaded into the SG Engine threshold counter. With each Interrupt On Complete event generated by the SG Engine (occurs whenever the AXI CDMA completes a transfer descriptor), the threshold count is decremented. When the count reaches zero, an IOC_Irq is generated by the SG Engine. If the CDMACR.IOC_IrqEn = 1, an interrupt is generated on the AXI CDMA `cdma_introut` signal.

If the delay interrupt feature is enabled (CDMACR.IRQDelay not equal to 0), a delay interrupt event causes a reload of the SG Engine interrupt threshold counter. In addition, a write by the software application to the threshold value (CDMACR.Threshold), the internal threshold counter is reloaded.

SG Delay Interrupt

The delay interrupt feature is used in conjunction with the interrupt coalescing filter. Using the delay interrupt feature allows the software application to guarantee it receives an interrupt from the AXI CDMA, when the interrupt threshold is not met but the programmed descriptor chain has been completely processed by the AXI CDMA. The delay interrupt timer feature is enabled by setting the CDMACR.IRQDelay value to a non-zero value. The delay time is loaded into an internal counter in the SG Engine when a SG session is started. The internal timer begins counting up whenever the AXI CDMA is idle (CDMASR.IDLE = 1). The delay timer is reset and halted whenever the AXI CDMA is not idle (CDMASR.IDLE = 0).

Error Interrupts

Any detected error results in the AXI CDMA gracefully halting. Per AXI4 protocol, all AXI transfers that have been committed with accepted address channel transfers must complete the associated data transfer. Therefore, the AXI CDMA completes all committed AXI4 transfers before setting the CDMASR.IDLE bit. When the CDMASR.IDLE bit is set to 1, the AXI CDMA engine is truly halted.

The pointer to the descriptor associated with the errored transfer is updated to the CURDESC_PNTR register. On the rare occurrence that more than one error is detected, only the CURDESC_PNTR register for one of the errors are logged. To resume operations, a reset must be issued to the AXI CDMA either by a hardware reset or by writing a 1 to the CDMACR.Reset bit.

The following is a list of possible errors:

- **DMAIntErr** – CDMA Internal Error indicates that an internal error in the AXI DataMover was detected. This can occur under two conditions. First, for the DataMover MM2S and S2MM channels, it can occur when a BTT = 0 is written to the primary AXI DataMover command input. This would happen if a transfer descriptor is fetched and executed with the CONTROL word having the BTT field = 0.
- **DMASlvErr** – CDMA Slave Error occurs when the slave to or from which data is transferred responds with a SLVERR.
- **DMADecErr** – CDMA Decode Error occurs when the address request is targeted to an address that does not exist.
- **SGIntErr** – Scatter Gather Internal Error occurs when a BTT = 0. This error only occurs if a fetched descriptor already has the Complete bit set. This condition indicates to the AXI CDMA that the descriptor has not been processed by the CPU, and therefore is considered stale.
- **SGSlvErr** – Scatter Gather Slave Error occurs when the slave to or from which descriptors are fetched and updated responds with a SLVERR.
- **SGDecErr** – Scatter Gather Decode Error occurs when the address request is targeted to an address that does not exist.

Note: Scatter Gather error bits are unable to be updated to the descriptor in remote memory. They are only captured in the associated channel CDMASR where the error occurred.

SECTION II: VIVADO DESIGN SUITE

Customizing and Generating the Core

Constraining the Core

Customizing and Generating the Core

This chapter includes information about using Xilinx tools to customize and generate the core in the Vivado™ Design Suite.

Vivado IP Catalog GUI Options

The AXI CDMA can be found in **\AXI_Infrastructure** and also in **Embedded_Processing\AXI_Infrastructure\DMA** in the IP catalog.

To access the AXI CDMA, perform the following:

1. Open a project by selecting **File** then **Open Project** or create a new project by selecting **File** then **New Project** in the Vivado integrated design environment (IDE.)
2. Open the IP catalog and navigate to any of the taxonomies.
3. Double-click **AXI Central Direct Memory Access** to bring up the AXI CDMA GUI.

Vivado Design Tools System Parameter Screen

The AXI CDMA GUI contains one screen ([Figure 4-1](#)) that provides information about the core, allow configuration of the core, and provides the ability to generate the core.

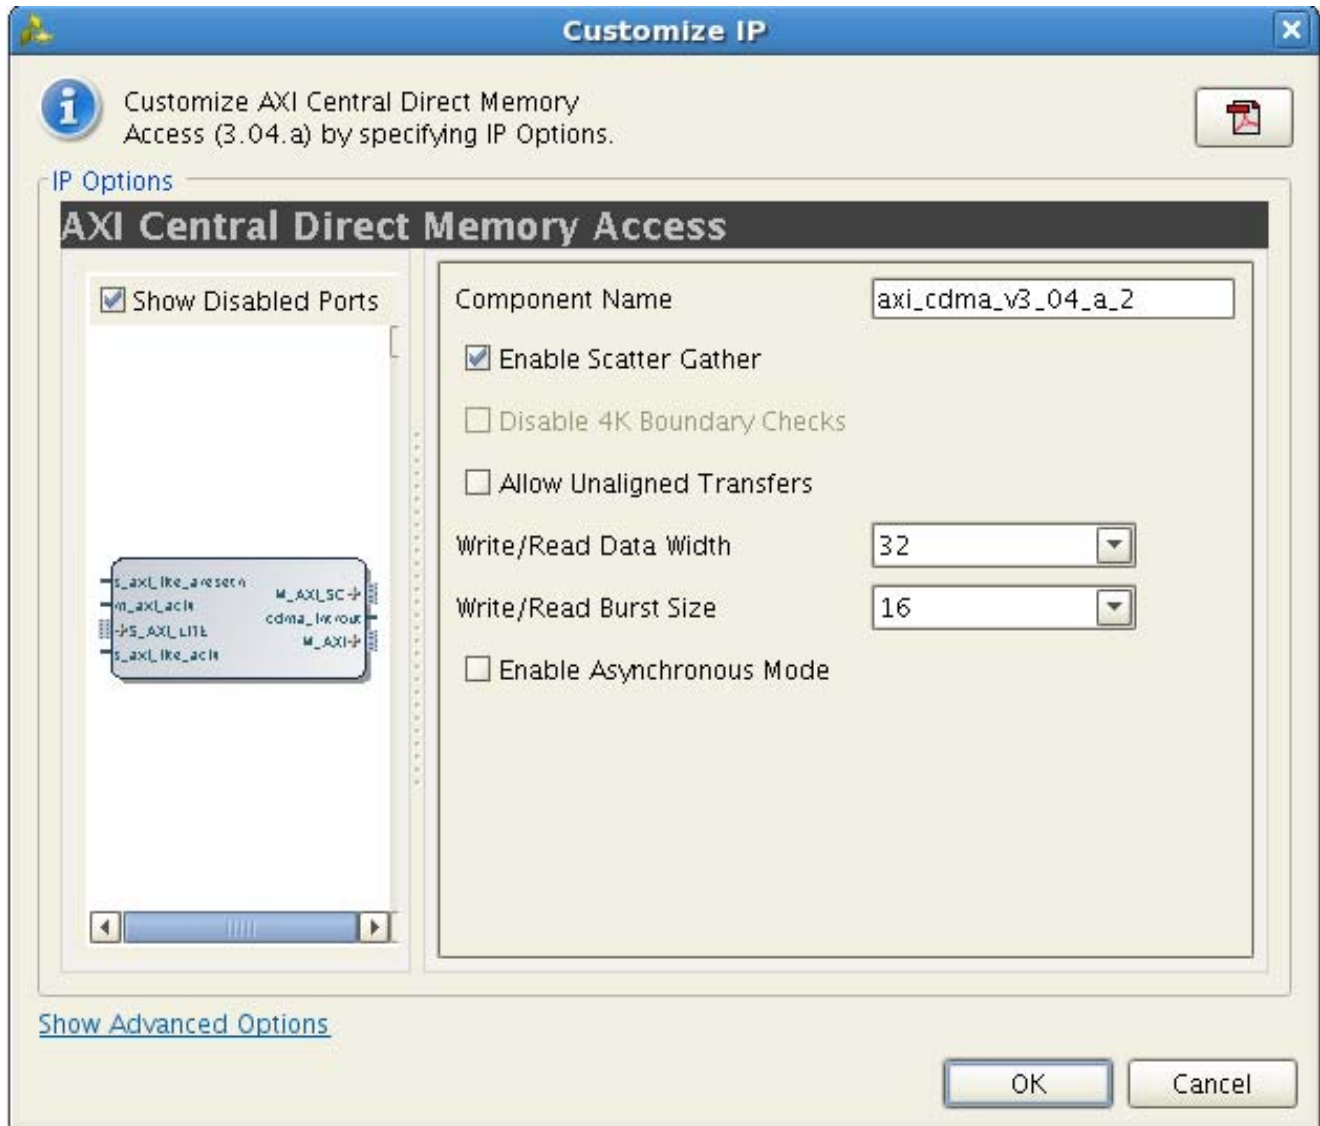

Figure 4-1: AXI CDMA GUI

- **Component Name** – The base name of the output files generated for the core. Names must begin with a letter and can be composed of any of the following characters: a to z, 0 to 9, and "_".

The following describe the fundamental options that affect both channels of the AXI CDMA core.

- **Enable Scatter Gather Engine** – Checking this option enables Scatter Gather Mode operation in AXI CDMA. Disabling the Scatter Gather Engine mode causes all output ports for the Scatter/Gather interface to be tied to zero, and all of the input ports to be left open.

- **Disable 4K Boundary Checks** – Checking this option puts the AXI CDMA in low resource utilization mode. This considerably reduces the performance and features of the AXI CDMA. This option is available only when Scatter Gather is disabled.
- **Allow Unaligned Transfers** – Enabling this allows the AXI CDMA to do unaligned memory access for Read and Write. This option is available only when Scatter Gather is enabled. Enabling this feature restricts the allowed values of data width to 32 and 64 only.
- **Read/Write Data Width** – Data width of the AXI Memory Mapped Read and Write data bus. Valid values are 32, 64, 128, 256, 512, and 1024.
- **Enable Asynchronous Mode** – Select this box if the clocks used in AXI CDMA are asynchronous.
- **Write/Read Burst Size** – Maximum Burst size of the AXI4 read/write operation. When using the Keyhole feature of AXI CDMA, this needs to be set to 16.

Output Generation

The output files generated from the IP catalog are placed in the project directory. The file output list can include some or all of the following files.

The component name of the IP generated is `axi_cdma_v3_04_a_0`.

Constraining the Core

There are no applicable constraints for this core in the Vivado™ Design Suite.

SECTION III: ISE DESIGN SUITE

Customizing and Generating the Core

Constraining the Core

Customizing and Generating the Core

This chapter includes information about using Xilinx tools to customize and generate the core in the ISE® Design Suite.

Generating the Core Using CORE Generator Tool

The AXI CDMA can be found in **\AXI_Infrastructure** and also in **Embedded_Processing\AXI_Infrastructure\DMA** in the CORE Generator™ GUI **View by Function** pane.

To access the AXI CDMA, perform the following:

1. Open a project by selecting **File > Open Project** or create a new project by selecting **File > New Project**.
2. Open the IP catalog and navigate to any of the taxonomies.
3. Double-click **AXI Central Direct Memory Access** to bring up the AXI CDMA GUI.

Configuring AXI CDMA Parameters

The AXI CDMA GUI contains one screen providing information about the core, allows for configuration of the core, and provides the ability to generate the core.

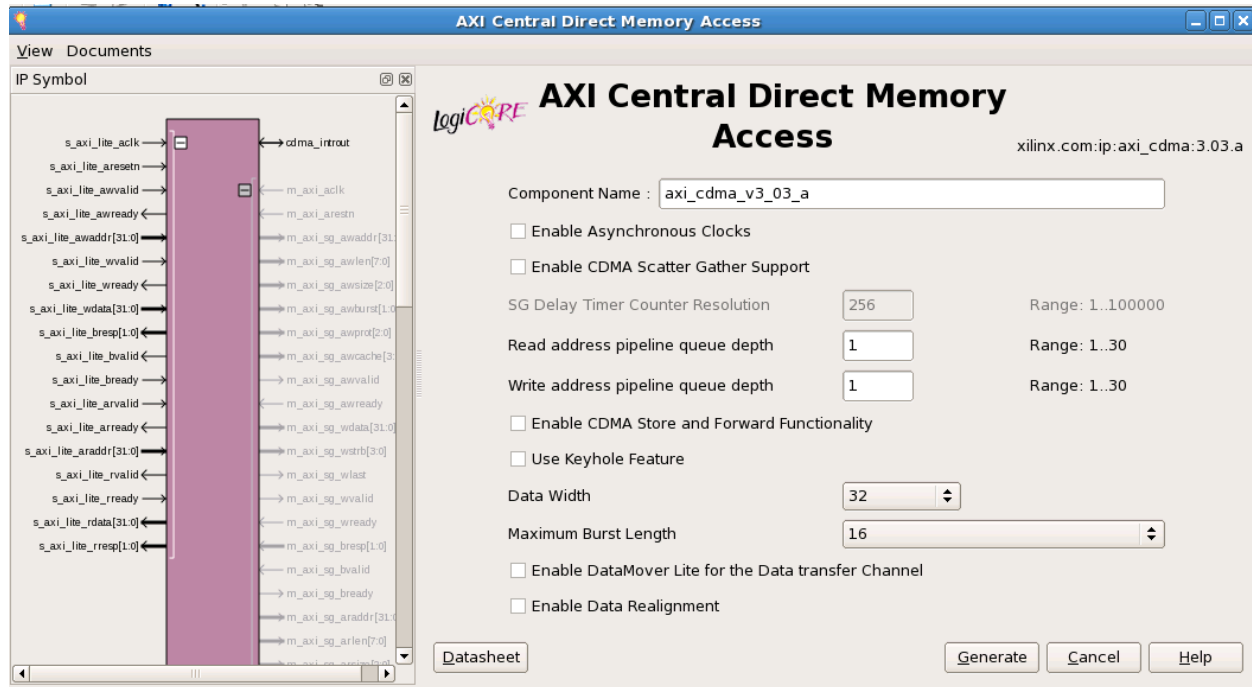

Figure 6-1: CORE Generator GUI

- **Enable Asynchronous Clocks** – AXI CDMA can be configured in an asynchronous mode by selecting the Enable Asynchronous Clocks check box. This enables the necessary logic that is required to synchronize the clock domain crossing paths.
- **Enable CDMA Scatter Gather Support** – Enable/Disable the Scatter Gather support. This can be enabled by selecting the check box. When set to 1, Scatter Gather support is enabled.
- **SG Delay Timer Counter Resolution** – This integer parameter is used to set the resolution of the Interrupt Delay Timer. The value assigned specifies the number of the input axi_aclk clock cycles between each tick of the delay timer. The Delay Timer is only used during Scatter Gather operations. For additional information, see SG Delay Interrupt.
- **Read Address Pipeline Queue Depth** – This check box sets the Read Address Pipeline depth for the Data read function. The effective address pipelining on the AXI4 Read Address Channel is the value assigned plus 2. If the value assigned is 1, the effective address pipelining on the AXI4 Read Address Channel is the value assigned plus 1.
- **Write Address Pipeline Queue Depth** – This check box sets the Write Address Pipeline depth for the Data write function. The effective address pipelining on the AXI4 Write Address Channel is the value assigned plus 2. If the value assigned is 1, the effective address pipelining on the AXI4 Write Address Channel is the value assigned plus 1.
- **Enable CDMA Store and Forward Functionality** – This check box enables/disables the CDMA store and forward feature.

- **Use Keyhole Feature** – Checking this box sets the Max burst length to 16. For Keyhole operation, the Maximum Burst Length should not exceed 16.
- **Data Width** – This integer parameter is used to size the AXI CDMA AXI4 data transport Data Channel related qualifiers. Allowed values are 32, 64, 128, 256, 512, and 1024.
- **Maximum Burst Length** – This parameter limits the burst length requested by CDMA on the AXI4 data transport interface.
A value of 256 is not allowed if the C_M_AXI_DATA_WIDTH parameter is assigned a value of 256. An AXI 4K address boundary crossing violation could occur otherwise.
- **Enable Datamover Lite for the Data Transfer Channel** – This parameter allows the CDMA data transport path to be implemented in a "lite" mode. Lite mode is useful for resource limited designs that requires smaller resource utilization traded off for high performance data transfer. This parameter is ignored if Scatter Gather support is enabled.
- **Enable Data Realignment** – Include or exclude the Data Realignment Engine. For use cases where all transfers are C_M_AXI_DATA_WIDTH aligned, this parameter can be set to 0 to exclude DRE, saving FPGA resources.
Setting this parameter to 1 allows data realignment to the byte (8 bits) address resolution on the data transport AXI4 interface. The DRE is only supported for Data Width 32 and 64.

When the DRE is included, CDMA data reads can start from any address byte offset (the transfer source address). DRE realigns the read data to match the starting offset of the programmed destination address.

Note: If the DRE is disabled (C_INCLUDE_DRE = 0) or DRE does not support the specified data width (C_M_AXI_DATA_WIDTH = 128 or 256), the offset of the transfer source address must match the offset of the transfer destination address. Offset is defined as that portion of a system address that is used to designate a byte position within a single data beat width. For example, a 32-bit data bus has four addressable byte positions within a single data beat (0, 1, 2, and 3). The portion of the address that designates these positions is the offset. The number of address bits used for the offset varies with the transfer bus data width.

Constraining the Core

This chapter contains information about constraining the core in the ISE® Design Suite.

Automatic Constraint Generation

The AXI CDMA v3_04_a incorporates a TCL file that automatically generates DATAPATHONLY constraints between the `m_axi_aclk` and the `s_axi_lite_aclk` domains. This only occurs when the parameter `C_AXI_LITE_IS_ASYNC` is assigned a value of 1 indicating the `m_axi_aclk` and `s_axi_lite_aclk` input ports are being driven with different clocks.

SECTION IV: APPENDICES

IP Migration

Debugging

Additional Resources

IP Migration

For information on migrating to the Vivado™ Design Suite, see *Vivado Design Suite Migration Methodology Guide* ([UG911](#)).

Debugging

This appendix includes details about resources available on the Xilinx Support website and debugging tools. In addition, this appendix provides a step-by-step debugging process and a flow diagram to guide you through debugging the AXI CDMA core core.

The following topics are included in this appendix:

- [Finding Help on Xilinx.com](#)
- [Debug Tools](#)
- [Hardware Debug](#)

Finding Help on Xilinx.com

To help in the design and debug process when using the AXI CDMA core, the [Xilinx Support web page](#) (www.xilinx.com/support) contains key resources such as product documentation, release notes, answer records, information about known issues, and links for opening a Technical Support WebCase.

Documentation

This product guide is the main document associated with the AXI CDMA core. This guide, along with documentation related to all products that aid in the design process, can be found on the Xilinx Support web page (www.xilinx.com/support) or by using the Xilinx Documentation Navigator.

Download the Xilinx Documentation Navigator from the Design Tools tab on the Downloads page (www.xilinx.com/download). For more information about this tool and the features available, open the online help after installation.

Release Notes

Known issues for all cores, including the AXI CDMA core are described in the [IP Release Notes Guide \(XTP025\)](#).

Known Issues

Answer Records include information about commonly encountered problems, helpful information on how to resolve these problems, and any known issues with a Xilinx product. Answer Records are created and maintained daily ensuring that users have access to the most accurate information available.

Answer Records for this core can be located by using the Search Support box on the main [Xilinx support web page](#). To maximize your search results, use proper keywords such as

- Product name
- Tool message(s)
- Summary of the issue encountered

A filter search is available after results are returned to further target the results.

Answer Records for the AXI CDMA core

No Answer Records are available.

Contacting Technical Support

Xilinx provides premier technical support for customers encountering issues that require additional assistance.

To contact Xilinx Technical Support:

1. Navigate to www.xilinx.com/support.
2. Open a WebCase by selecting the [WebCase](#) link located under Support Quick Links.

When opening a WebCase, include:

- Target FPGA including package and speed grade.
- All applicable Xilinx Design Tools and simulator software versions.
- Additional files based on the specific issue might also be required. See the relevant sections in this debug guide for guidelines about which file(s) to include with the WebCase.

Debug Tools

ChipScope Pro Debugging Tool

The ChipScope™ Pro debugging tool inserts logic analyzer, bus analyzer, and virtual I/O cores directly into your design. The ChipScope Pro debugging tool allows you to set trigger conditions to capture application and integrated block port signals in hardware. Captured signals can then be analyzed through the ChipScope Pro logic analyzer tool. For detailed information for using the ChipScope Pro debugging tool, see www.xilinx.com/tools/cspro.htm.

Hardware Debug

Some of the common problems encountered and possible solutions follow.

- You have programmed your BD ring but nothing seems to work.

Register programming sequence has to be followed to start the CDMA. See [Programming Sequence in Chapter 3](#).

- Internal Error/Error bits set in the Status register

Internal error could be set when BTT specified in the descriptor is 0. SG internal error would be set if the fetched BD is a completed BD. Other error bits like Decode Error or Slave Error could also be set based on the response from Interconnect or Slave.

- You are reading data from a location, but the data does not seem to be in order.

Verify if the start address location is aligned or un-aligned. If it is un-aligned, ensure that the DRE is enabled while configuring CDMA.

Additional Resources

Xilinx Resources

For support resources such as Answers, Documentation, Downloads, and Forums, see the Xilinx Support website at:

www.xilinx.com/support.

For a glossary of technical terms used in Xilinx documentation, see:

www.xilinx.com/company/terms.htm.

References

To search for Xilinx documentation, go to www.xilinx.com/support.

Unless otherwise noted, IP references are for the product documentation page.

The following document provides supplemental material useful with this product guide:

1. *LogiCORE IP AXI Interconnect Product Guide* ([PG059](#))
2. *Vivado Design Suite Migration Methodology Guide* ([UG911](#))

Technical Support

Xilinx provides technical support at www.xilinx.com/support for this LogiCORE™ IP product when used as described in the product documentation. Xilinx cannot guarantee timing, functionality, or support of product if implemented in devices that are not defined in the documentation, if customized beyond that allowed in the product documentation, or if changes are made to any section of the design labeled DO NOT MODIFY.

See the IDS Embedded Edition Derivative Device Support web page (www.xilinx.com/ise/embedded/ddsupport.htm) for a complete list of supported derivative devices for this core.

See the IP Release Notes Guide ([XTP025](#)) for more information on this core. For each core, there is a master Answer Record that contains the Release Notes and Known Issues list for the core being used. The following information is listed for each version of the core:

- New Features
- Resolved Issues
- Known Issues

Revision History

The following table shows the revision history for this document.

Date	Version	Description of Revisions
04/24/12	1.0	Initial Xilinx Release This new document is based on the <i>LogiCORE IP AXI CDMA Product Specification (DS792)</i>
07/11/12	1.1	Template update.
07/25/12	2.0	<ul style="list-style-type: none"> • Updated for Vivado 2012.2, Zynq features, and ISE v14.2 • Added Vivado content in Customizing and Generating the Core
10/16/12	2.5	<ul style="list-style-type: none"> • Updated for Vivado 2012.3 and ISE v14.3 design tools. • Document clean up.
12/18/12	2.6	<ul style="list-style-type: none"> • Updated for Vivado 2012.4 and ISE v14.4 design tools. • Updated Table 2-1, Maximum Frequencies • Updated DEbugging appendix. • Updated resource utilization tables: Tables 2-3, 2-4, and 2-5. • Removed Table 3-1, Reset Assertion/Deassertion Stabilization Times • Removed Parameter Descriptions section • Updated screen capture for Chapter 4 and removed one screen. • Removed material from the Output Generation section in Chapter 4 and updated the output hierarchy.
